Eriksson 1996 *(Continued)*

Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "in a double-blind fashion" Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "the anesthetic technique used). However, all recovery variables were assessed by the same research nurse to avoid person-to-person variation in assessments. No preanesthetic medication was used" Judgement comment: no information on blinding
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "three patients were excluded from the study (two from Group DO and one from Group PROP) due to surgical complications"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Duration of study: September 2004 to March 2005

Language: English

Study's primary outcome: pain intensity in VAS score

Trial registry number: NA

Notes	Four out of 5 groups relevant (group C without bupivacaine infiltration), control groups II and IV combined, experimental groups I and III combined for analysis

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "each individual was randomly assigned to one of five groups by envelopes" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "by envelopes that identified the treatment to be received" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "the parameters were recorded at 1, 4, 8, 16, 20, and 24 hours after surgery by a pain clinic nurse who visited each patient" Judgement comment: insufficient information on blinding ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "there were no significant differences among the five study groups with respect to mean age, sex distribution, mean weight, proportions of ASA classifications, mean operating time, or mean amount of fentanyl used during the operation (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear; (gender): yes

- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Outcomes	*Vomiting (0 to 2 hours)* • Outcome type: dichotomous outcome *Vomiting (2 to 6 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** work was supported by a project grant (financial support, drug supply) from Air Liquide Santé International to MC. The funder had no role in study design, data collection and analysis, decision to publish, or preparation of the manuscript **Country:** Germany **Setting:** inpatient, single-centre **Author's name:** Mark Coburn **Institution:** Department of Anesthesiology, University Hospital Aachen, Aachen, Germany **Email:** mcoburn@ukaachen.de **Address:** Department of Anesthesiology, University Hospital Aachen, Aachen, Germany **Language:** English **Duration of study:** November 2008 to March 2011 **Trial registry number:** EUCTR2008-004132-20, NCT00793663 **Study's primary outcome:** Nausea during PACU stay
Notes	Four groups, factorial design (different anaesthesia regimen with or without prophylaxis). Groups with same interventions pooled for analysis

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "...size 10; allocation ratio 1:1). The randomization lists were generated by computer allocation using a randomization-software (RandList version 1.2, DatInf) by a member of the clinic staff independent from the study team and sealed in an opaque..."

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Fahlenkamp 2016 *(Continued)*

Allocation concealment (selection bias)	Low risk	Quote: "to a serious adverse event. Randomization codes for the type of anesthesia were sealed in opaque envelopes parameterized with the corresponding study number on the outside, and were opened by the study physician on the day of surgery shortly before the start of intervention. Anesthesia technique was blinded to..."
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...with the individual study number. Participants, study physicians, and outcome assessors were blinded to the type of prophylactic treatment. Trial Procedure A sketch of..."
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...with the individual study number. Participants, study physicians, and outcome assessors were blinded to the type of prophylactic treatment. Trial Procedure A sketch of..."
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "occurred in seven cases (¥): One patient withdrew his consent; two were excluded after randomization for safety reasons. Two patients did not receive the scheduled surgery; two did not receive the allocated intervention for administrative reasons. Post interventional drop-out in the sevoflurane group occurred in nine cases (&): One patient dropped out due to a serious adverse event not associated with the study intervention. Eight patients of the sevoflurane group were excluded from data analysis because of violation of the study protocol. 94 patients in the sevoflurane group received the allocated intervention and data analysis, with 44 cases of dexamethasone as randomized prophylactic treatment and 50 placebo. Two patients (#) did not complete the 24h-follow-up because of withdrawal due to severe nausea. Their data until the time of dropout was included into the final analysis. doi:10.1371/journal.pone.0153807.g002 Nausea and Vomiting following" Judgement comment: dropout rate at 24 hours > 15%. Seven participants withdrew due to severe nausea, and data only until the time of dropout were recorded
Selective reporting (reporting bias)	High risk	Judgement comment: EUCTR2008-004132-20 (prospective registration), NCT00793663 (prospective registration). One of the prospectively registered primary outcomes (1. hypnosis, 2. nausea, 3. reduction of VRS nausea) was omitted in the final study report (hypnosis). Assessment of timing differs between protocol and study report
Other bias	Unclear risk	Quote: "...completed the 24h follow-up. The groups were not different with respect to patient age, height, body mass index, gender, ASA status, PONV history and Apfel Score (Table 1). The mean Apfel Score was lower than expected (Table 1). The study groups did not differ with respect to type of surgery, anesthesia duration, additional epidural, and ongoing and post anesthesia piritramide doses (Table 2). Relevant differences were observed in the total dose of propofol administered for induction, and the use of oxygen and remifentanil during maintenance of anesthesia (Table 2). The PACU stay..." Judgement comment: no data on baseline characteristics nor potential effect modifiers for subgroups (antiemetic prophylaxis) provided

Included criteria: patients undergoing elective laparoscopic cholecystectomy

Excluded criteria: ASA IV; age over 75 years; body mass index > 30; pregnancy; signs of endocrine, renal, hepatic, or immunological disease; use of opioids or tranquillizers less than 1 week before the operation; treatment with steroids; history of alcohol or drug abuse; preoperative diagnosis of gallbladder empyema; previous endoscopic sphincterotomy for common bile duct stones

Pretreatment: baseline characteristics (age, weight, ASA): unclear (data not shown). Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): unclear (data not shown)

Interventions

Intervention characteristics

Dexamethasone

- *Dose*: 8 mg
- *Time point of administration*: 90 minutes before skin incision
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg; 10%

Placebo group

- *Dose*: saline
- *Time point of administration*: 90 minutes before skin incision
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg; 44%

Outcomes

Vomiting (0 to 24 hours)

- Outcome type: dichotomous outcome

Nausea (0 to 24 hours) or PONV

- Outcome type: dichotomous outcome

Postoperative wound infection (0 to 24 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Feroci 2011 *(Continued)*

Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "identical syringes were prepared by staff who were not involved in the study according to the random number list. The patients, anesthetists, and investigators who collected the postoperative data were blinded to the randomization process and to the types of drugs administered"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "investigators who collected the postoperative data were blinded to the randomization process and to the types of drugs administered"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "between January 2009 and December 2009, 114 patients underwent surgery for thyroid disease at our institution. Ten patients were excluded from the randomization according to the following exclusion criteria: 2 patients who had a previous malignant disease, 2 patients who had undergone previous thyroid surgery, 4 patients who had insulin-dependent diabetes mellitus, and 2 patients because of the lack of any comprehension of the Italian language. Two patients in the control arm were excluded from all analyses due to a postoperative hemorrhage requiring an urgent reparative operation. Therefore, data from 102 patients (51 for each group) were available for the analysis per protocol. One other patient in the dexamethasone group was excluded from subjective voice function analysis due to a verified lesion on the recurrent laryngeal nerve"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT00888303 (retrospective registration)
Other bias	Unclear risk	Quote: "there were no statistically significant differences between the 2 groups with regard to patient demographics, operation type, postoperative morbidity, and length of stay (Table 1)" Judgement comment: baseline characteristics (age, ASA): no; (weight): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

Forrester 2007

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis and combination prophylaxis
Participants	**Baseline characteristics** Meclizine + ondansetron • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: NA • *Received treatment (n)*: NA • *Analysed (n)*: 39 • *Age (mean ± SD, median (IQR), median (range))*: 35.5 ± 9.4 • *Weight (mean ± SD, median (IQR), median (range))*: 68.05 ± 10.33 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 92.31 • *Non-smoker (%)*: 92.31

Forrester 2007 *(Continued)*

- *History of PONV/motion sickness (%)*: 69.23/74.36
- *Type of general anaesthesia*: inhalational anaesthesia (iso-/sevo-/desflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 129.79
- *Use of perioperative opioids (if yes, which?)*: NA
- *Type of surgery*: NA

Ondansetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: NA
- *Received treatment (n)*: NA
- *Analysed (n)*: 38
- *Age (mean ± SD, median (IQR), median (range))*: 39.8 ± 11.2
- *Weight (mean ± SD, median (IQR), median (range))*: 76.47 ± 13.52
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 81.58
- *Non-smoker (%)*: 89.47
- *History of PONV/motion sickness (%)*: 68.42/89.47
- *Type of general anaesthesia*: inhalational anaesthesia (iso-/sevo-/desflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 136.21
- *Use of perioperative opioids (if yes, which?)*: NA
- *Type of surgery*: NA

Included criteria: consented for surgery under general anaesthesia scheduled for 60 minutes or longer, ASA I or II, 18 to 65 years of age, English language proficiency, presence of 4 of 5 risk factors for PONV (general anaesthesia, female gender, non-smoker, history of motion sickness, history of PONV)

Excluded criteria: contraindications to receiving general anaesthesia, history of sensitivity to ondansetron or meclizine, antiemetic use within 24 hours of surgery, pregnancy, gastro-oesophageal reflux disease, obesity with a body mass index > 35

Pretreatment: baseline characteristics (age, ASA): no; (weight): yes. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Interventions	**Intervention characteristics** Meclizine + ondansetron • *Dose*: meclizine 50 mg, ondansetron 4 mg • *Time point of administration*: meclizine within 15 to 30 minutes before surgery, ondansetron 15 to 30 minutes before end of surgical procedure • *Route of administration*: meclizine PO, ondansetron IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV, metoclopramide 10 to 20 mg IV, promethazine 12.5 to 25 mg IV Ondansetron • *Dose*: placebo tablets, ondansetron 4 mg • *Time point of administration*: placebo within 15 to 30 minutes before surgery, ondansetron 15 to 30 minutes before end of surgical procedure • *Route of administration*: placebo PO, ondansetron IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV, metoclopramide 10 to 20 mg IV, promethazine 12.5 to 25 mg IV
Outcomes	*Adverse events (general notes in the publication, 24 hours' observation)*

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the enrolled subjects then were randomly assigned by the pharmacy to 1 of 2 groups using a computer-generated random numbers process"
Allocation concealment (selection bias)	Low risk	Quote: "group 2 (placebo and ondansetron). The pharmacist placed two 25 mg meclizine tablets (50 mg total) or 2 placebo tablets in an opaque brown plastic bag. The bag labeled 'meclizine study'..."
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the opaque bag was used to ensure that the investigators were blinded to the study drug because a placebo with an appearance identical to that of meclizine was unavailable. Negative pregnancy test results were verified for all female subjects before study enrollment. Within 15 to 30 minutes before surgery, patients were given the “study drug” with no more than 2 ounces of water by a staff member. When taking the study drug, patients were asked to close their eyes so they would remain blinded to the physical characteristics of the pills. The staff member who administered the study medication preoperatively was not allowed to participate in the care of the patient postoperatively to maintain the integrity of the double-blind study" Judgement comment: participants may be able to recognize their allocation (different physical appearance of the pills)
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "on arrival in the PACU, the data collection tools were delivered to the PACU personnel, who were also blinded to the treatment group"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 84 subjects were enrolled, but 7 were removed from the study because of breaches in protocol or a change in anesthetic management, leaving a total of 77 subjects (group 1, 39; group 2, 38) for the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Forrester 2007 *(Continued)*

Other bias	Unclear risk	Quote: "with the exception of patient weight, there were no significant differences in relation to demographic variables, including surgical time, anesthesia time, smoking history, or history of motion sickness or PONV between groups (Table)" Judgement comment: baseline characteristics (age, ASA): no; (weight): yes. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Fortney 1998

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 4 groups, monoprophylaxis

Language: English

Duration of study: NA

Trial registry number: NA

Study's primary outcome: complete response (no emetic episodes, no requirement for rescue antiemetic medications)

Notes	Data from 2 identical studies at 50 centres were merged (combined data were extracted)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "each patient was then randomized to one of four treatments" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "...or ondansetron 4 mg. All drugs were mixed with 0.9% saline to a final volume of 10 mL and administered in a double-blind fashion no more than 20 min before the induction of anesthesia. After study drug administration..." Judgement comment: insufficient information on blinding
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "study personnel recorded episodes of nausea or vomiting and adverse events during the study period" Judgement comment: insufficient information on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...than in the placebo group. Follow-up data after discharge from the ambulatory surgery unit were available for 2025 patients. Of those patients who returned the evaluation, not all completed the nausea assessment. The results in Table 3..." Judgement comment: missing data were balanced across all treatment groups and reasons for missing data were reported
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "were therefore combined and reanalyzed. The treatment groups were similar with respect to age, weight, gender, history of susceptibility to motion sickness, history of nausea with general anesthetics, duration of anesthesia, and emergence times (Table 1). There was also no significant difference among the treatment groups in the type of surgery performed (Table 2), with most patients undergoing gynecological..." Quote: "group (69%, P < 0.05). In an u posteriori analysis of postoperative analgesic use, the proportion of patients to whom opioid analgesics were administered was significantly less in the droperidol 1.25 mg group (65%, P < 0.001) compared with the ondansetron group (73%) and the placebo group (75%). The proportion of patients to whom opioid analgesics were administered was also significantly less in the droperido10.625 mg group (69%, P < 0.05) compared with that in the placebo group. Follow-up data after discharge from..."

Gan 2007 *(Continued)*

	Study's primary outcome: primary efficacy endpoint was proportion of patients with complete response, defined as no vomiting and no use of rescue therapy, in the 24 hours after surgery, to be tested for superiority of aprepitant
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "...using a computer-generated random allocation schedule stratified according to gender"
Allocation concealment (selection bias)	Low risk	Quote: "to ensure blinding among staff employed by the sponsor who were involved with the study, the randomization schedule was generated by a statistician who was otherwise uninvolved with the study. On the day of surgery, patients were randomized to one of three preoperative treatments: oral aprepitant 40 mg, oral aprepitant 125 mg, or IV ondansetron 4 mg. Matching placebos were used to maintain blinding. Blinded allocation schedules and supplies of aprepitant were provided by the sponsor, and each study site designated an unblinded pharmacist to receive, store, and prepare the ondansetron and saline placebo"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "each study site designated an unblinded pharmacist to receive, store, and prepare the ondansetron and saline placebo"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: outcome assessors were blinded due to study design
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "disposition of the 805 patients randomized into the study is shown in Figure 1. All randomized patients who received study drug (n 766) were included in the tolerability assessments; data were excluded from 39 patients who either did not receive any study drug (n 34) or who, due to incorrect preparation of the vial for IV administration at the study site, received either placebo for aprepitant and placebo for ondansetron, or active aprepitant and active ondansetron (n 5). The efficacy analyses excluded these 39 patients plus another 14 patients who either did not undergo surgery but did receive drug (n 1), did not have posttreatment efficacy assessments (n 2), or did not receive Vial B but received active drug in Bottle A (n 11). An additional 19 patients, for whom significant violations of study conduct and data collection occurred at one site, were also excluded from the efficacy analyses before unblinding occurred, although safety data from these 19 patients were included in the safety assessments"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT00090155 (retrospective registration)
Other bias	Unclear risk	Quote: "the treatment groups also did not differ in terms of patient baseline characteristics, including risk factors for PONV (Table 1)" Judgement comment: baseline characteristics (age, ASA): no; (weight): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Duration of study: NA

Trial registry number: NA

Study's primary outcome: primary efficacy endpoint was complete antiemetic response through 24 hours after end of surgery

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "independent research personnel not associated with the study used a random number generator in a sealed envelope technique to randomly assign patients to one of two treatment groups"
Allocation concealment (selection bias)	Low risk	Quote: "...in a sealed envelope technique to randomly assign patients to one of two treatment groups" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE), but randomization was performed by research personnel not associated with the study
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "patients received either an active TDS patch or a similar appearing sham over the mastoid area 2 h before entering the operating room" Judgement comment: no information on blinding of personnel. TDS patches and sham patches only called "similar" - not identical
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 620 patients who were randomly assigned to treatment, 618 were treated (two patients were withdrawn by the investigator and did not receive study medication). Figure 1 illustrates the patient screening and random assignment process. The treatment groups were comparable with respect to demographic data and clinical characteristics (Table 1)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the treatment groups were comparable with respect to demographic data and clinical characteristics (Table 1)"

Gan 2011 *(Continued)*

Address: Department of Anesthesiology, Duke University Medical Center, CB 3094, Durham, NC 27710, USA

Language: English

Duration of study: NA

Trial registry number: NCT00539721

Study's primary outcome: primary endpoint was response rate of subjects who did not experience any emetic episodes (regardless of rescue medication use) for 0 to 24 hours

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "randomization was performed before surgery according to a computer-generated randomization schedule"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...of PONV or motion sickness. Blinding was ensured with matching placebo capsules. Intravenous ondansetron (2 mL) and saline placebo (2 mL) were prepared by the pharmacists in a blinded 3-mL syringe. Oral rolapitant or placebo..."
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement on outcome assessors
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "six hundred nineteen subjects were randomized from 37 centers; of these, 532 subjects completed the trial through 30- to 60-day follow-up (Fig. 1). Of the 87 patients who did not complete the study, 30 were lost to follow-up, 26 withdrew for reasons unrelated to study medication, 12 discontinued the study because of protocol ineligibility, 11 were discontinued because of non-compliance with the protocol, 4 were discontinued because of administrative reasons, 3 were discontinued because of AEs, and 1 was discontinued because of incisional pain" Judgement comment: rate of missing outcome data > 15%. Three participants discontinued due to AEs
Selective reporting (reporting bias)	Low risk	Judgement comment: NCT00539721 (prospective registration). The prospectively registered primary outcome was reported in the pre-specified way in the final study report
Other bias	Low risk	Quote: "there were no differences in the distribution of the discontinued patients among the groups. Demographic data and patient characteristics were no different among groups (Table 1)" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, perioperative opioids, history of PONV/motion sickness): no

Identification	**Sponsorship source:** supported by Acacia Pharma Ltd, Cambridge, United Kingdom **Country:** France, Germany, United States **Setting:** inpatient, multi-centre (4 sites in France, 6 in Germany, 9 in the USA) **Author's name:** Tong J. Gan **Institution:** Department of Anesthesiology, Stony Brook University Medical Center, Stony Brook, New York, USA **Email:** tong.gan@stonybrookmedicine.edu **Address:** Department of Anesthesiology, Stony Brook University, HSC Level 4, Rm 060, Stony Brook, New York 11794, USA **Language:** English **Duration of study:** July 2013 to January 2014 **Trial registry number:** NCT01991821, NCT01991860 **Study's primary outcome:** primary endpoint was complete response, defined as no vomiting/retching and no use of antiemetic rescue medication in the 24 hour postoperative period
Notes	Two essentially identical studies (EU, USA): pooled results were used for this systematic review

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were randomly allocated on a 1:1 basis to receive a single iv dose of either 5 mg amisulpride or an identical placebo via a web-based randomization service, which automatically provided the next patient number from a predetermined randomization list created by an independent statistician. The list was stratified according to whether the patient had two, three, or four risk factors"
Allocation concealment (selection bias)	Low risk	Quote: "each subject number provided by the system matched a vial of study drug held at the study site, the identity of which was blinded to everyone except the contract manufacturer responsible for clinical packaging"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...the identity of which was blinded to everyone except the contract manufacturer responsible for clinical packaging. The study drug was given by slow iv administration during 1 to 2 min at induction of anesthesia"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "each subject number provided by the system matched a vial of study drug held at the study site, the identity of which was blinded to everyone except the contract manufacturer responsible for clinical packaging..."
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "in total, 689 subjects were randomized in the two studies and received active or placebo study treatment, 342 in the United States and 347 in Europe, of whom 626 were evaluable per protocol. Of the 63 subjects excluded from the pp population, all but one had either inadvertently received an antiemetic before, during, or after their operation, but before any event of PONV, or had a very short operation of 20 min or less"

Gan 2017 *(Continued)*

Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT01991821, NCT01991860 (retrospective registration)
Other bias	Unclear risk	Quote: "the study arms were well balanced in terms of risk of PONV as estimated by prospectively ascertained risk factors" Judgement comment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Gandhi 2009

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 3 groups, monoprophylaxis and combination prophylaxis
Participants	**Baseline characteristics** Promethazine (group P) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 50 • *Received treatment (n)*: 50 • *Analysed (n)*: 50 • *Age (mean ± SD, median (IQR), median (range))*: 35.92 ± 10.98 • *Weight (mean ± SD, median (IQR), median (range))*: 51.78 ± 12.61 • *BMI (mean ± SD, median (IQR), median (range))*: 21.76 ± 4.89 • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 96 • *Non-smoker (%)*: 98 • *History of PONV/motion sickness (%)*: NA/0 • *Type of general anaesthesia*: inhalational anaesthesia (N_2O) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 145.30 • *Use of perioperative opioids (if yes, which?)*: pethidine 1 mg/kg before surgery • *Type of surgery*: major gynaecological surgery, laparoscopic surgery, middle ear surgery Promethazine + ondansetron (group O) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 50 • *Received treatment (n)*: 50 • *Analysed (n)*: 50 • *Age (mean ± SD, median (IQR), median (range))*: 35.44 ± 9.55 • *Weight (mean ± SD, median (IQR), median (range))*: 53.72 ± 10.48 • *BMI (mean ± SD, median (IQR), median (range))*: 22.91 ± 4.48 • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 98 • *Non-smoker (%)*: 98 • *History of PONV/motion sickness (%)*: NA/0 • *Type of general anaesthesia*: inhalational anaesthesia (N_2O)

Gandhi 2009 *(Continued)*

- *Duration of anaesthesia or surgery (in min; as mean or median)*: 149.70
- *Use of perioperative opioids (if yes, which?)*: pethidine 1 mg/kg before surgery
- *Type of surgery*: major gynaecological surgery, laparoscopic surgery, middle ear surgery

Promethazine + dexamethasone (group D)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 50
- *Received treatment (n)*: 50
- *Analysed (n)*: 50
- *Age (mean ± SD, median (IQR), median (range))*: 37.32 ± 10.67
- *Weight (mean ± SD, median (IQR), median (range))*: 54.76 ± 11.00
- *BMI (mean ± SD, median (IQR), median (range))*: 23.73 ± 4.26
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 98
- *Non-smoker (%)*: 98
- *History of PONV/motion sickness (%)*: NA/0
- *Type of general anaesthesia*: inhalational anaesthesia (N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 160.90
- *Use of perioperative opioids (if yes, which?)*: pethidine 1 mg/kg before surgery
- *Type of surgery*: major gynaecological surgery, laparoscopic surgery, middle ear surgery

Included criteria: ASA I and II; adult patients of either gender; between 18 and 60 years of age; undergoing elective gynaecological, laparoscopic, or middle ear surgery under general anaesthesia

Excluded criteria: history of motion sickness, or gastrointestinal, hepatic, or renal disease, or cardiovascular, metabolic, or endocrine dysfunction; any antiemetic medication 24 hours before surgery; preoperative nausea or vomiting; pregnancy or lactation; scheduled to have a nasogastric tube in situ after surgery

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of motion sickness): no; (history of PONV, perioperative opioids): unclear

---

Interventions

Intervention characteristics

Promethazine (group P)

- *Dose*: promethazine 0.5 mg/kg, placebo 5 mL normal saline
- *Time point of administration*: promethazine 5 minutes before surgery, placebo immediately after induction of anaesthesia
- *Route of administration*: IM, IV
- *Rescue antiemetics (if yes, which?)*: 10 mg IV metoclopramide

Promethazine + ondansetron (group O)

- *Dose*: promethazine 0.5 mg/kg, ondansetron 4 mg
- *Time point of administration*: promethazine 5 minutes before surgery, ondansetron immediately after induction of anaesthesia
- *Route of administration*: IM, IV
- *Rescue antiemetics (if yes, which?)*: 10 mg IV metoclopramide

Promethazine + dexamethasone (group D)

- *Dose*: promethazine 0.5 mg/kg, dexamethasone 8 mg
- *Time point of administration*: promethazine 5 minutes before surgery, dexamethasone immediately after induction of anaesthesia

Identification	**Sponsorship source:** NA **Country:** Nepal **Setting:** inpatient, single-centre **Author's name:** Binod Gautam **Institution:** Department of Anaesthesiology and Intensive Care, Kathmandu Medical College, Sinamangal, Nepal **Email:** gautambinod2060@hotmail.com **Address:** Dept. of Anaesthesiology and Intensive Care, Kathmandu Medical College, Sinamangal, PO Box 23760, Nepal **Language:** English **Duration of study:** NA **Trial registry number:** NA **Study's primary outcome:** complete response in 24 hours (no episode of PONV)
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "randomization list was prepared before anaesthesia using a computer-generated random number table"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "identical syringes containing each treatment regimen were diluted with normal saline to make a volume of 5 ml by a personnel not involved in the study. Drug preparations were administered IV just before induction of anaesthesia"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all observations were recorded by direct questioning (with only two possible answers of yes/no) by trained on-duty doctors blinded to the group assignment, or based on spontaneous complaint by the patients"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "out of 150 patients enrolled, eight patients required conversion to open cholecystectomy because of surgical reasons and were excluded from the study. Data obtained from the remaining 142 patients were analyzed for interpretation"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "patient characteristics and the factors related to surgery and anaesthesia did not differ between the groups (Table 1). Time to first meperidine demand, VAS pain scores and meperidine consumption during 24 hour period were similar among all groups (Table 2)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

- *Use of perioperative opioids (if yes, which?)*: 167.6 mg fentanyl intraoperatively, 776.4 mg postoperatively via PCA
- *Type of surgery*: laparoscopic cholecystectomy

Included criteria: adults, 20 to 65 years of age, either sex, ASA I or II, scheduled for laparoscopic cholecystectomy under general anaesthesia

Excluded criteria: impaired kidney or liver functions, history of drug or alcohol abuse, history of chronic pain or daily intake of analgesics, uncontrolled medical disease (diabetes mellitus and hypertension), history of intake of NSAIDs within 24 hours before surgery, inability to operate a patient-controlled analgesia device

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker): unclear; (perioperative opioids): yes

Interventions	**Intervention characteristics**

Methylprednisolone

- *Dose*: 125 mg
- *Time point of administration*: before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV

Placebo + etoricoxib

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Gautam 2014 *(Continued)*

- *Dose*: placebo tablet, 120 mg
- *Time point of administration*: 1 hour before induction
- *Route of administration*: PO
- *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV

Methylprednisolone + etoricoxib

- *Dose*: methylprednisolone 125 mg, etoricoxib 120 mg
- *Time point of administration*: 1 hour before induction, before induction of anaesthesia
- *Route of administration*: PO, IV
- *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV

Placebo

- *Dose*: placebo tablet, sterile water
- *Time point of administration*: 1 hour before induction, before induction of anaesthesia
- *Route of administration*: PO, IV
- *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV

Outcomes

PONV (probably 0 to 24 hours)

- Outcome type: dichotomous outcome

Sedation/drowsiness (probably 0 to 24 hours)

- Outcome type: dichotomous outcome

Identification

Sponsorship source: NA

Country: India

Setting: NA

Author's name: Sujeet Gautam

Institution: Department of Anesthesiology, Sanjay Gandhi Post Graduate Institute of Medical Sciences

Email: docsksg@gmail.com

Address: Department of Anaesthesiology, Sanjay Gandhi Post Graduate Institute of Medical Sciences, Raebareli Road, Lucknow 226 014, India

Duration of study: October 2012 to September 2013

Language: English

Study's primary outcome: severity of postoperative pain both at rest (static pain) and while coughing (dynamic pain), apostoperative fentanyl consumption

Trial registry number: NA

Notes

Groups with methylprednisolone ± etoricoxib were pooled as experimental group for analysis. Groups with placebo ± etoricoxib were pooled as control group for analysis

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients meeting the inclusion criteria during the pre-anesthetic checkup were randomly assigned into four equal groups of 30 each with the

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Gautam 2014 *(Continued)*

		help of a computer-generated table of random numbers. A random allocation sequence concealed in 120 consecutively numbered, sealed envelopes..."
Allocation concealment (selection bias)	Unclear risk	Quote: "random allocation sequence concealed in 120 consecutively numbered, sealed envelopes, determining group distribution, was computer-generated by a project nurse not otherwise involved in the trial" Judgement comment: not stated' "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all study personnel and participants were blind to the group allocation for the duration of the study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all of these measures were assessed by an anesthesia registrar blind to group allocation"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "the reasons for patients not being randomized were refusal to participate in the study (18 patients), chronic analgesic consumption (2 patients) and an inability to operate the patient-controlled analgesia device (3 patients). Eight patients were excluded from the study following the initial randomization process and were therefore not subjected to further analysis (7 underwent a conversion to open cholecystectomy and 1 needed re-exploration on account of postoperative bleeding)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "postoperative pain (static and dynamic) and fentanyl consumption were significantly reduced by methylprednisolone, etoricoxib and the combination groups as compared with the placebo ($P < 0.05$) (Table 2). The methylprednisolone + etoricoxib combination caused a significant reduction in postoperative pain and fentanyl consumption as compared to methylprednisolone or etoricoxib alone ($P < 0.05$) (Table 2)" Quote: "there were no differences amongst the groups with regard to age, sex, weight distribution, the duration of anesthesia, the duration of surgery or the level of intra-operative fentanyl consumption ($P > 0.05$) (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker): unclear; (perioperative opioids): yes

Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 277 patients enrolled in the two studies, 34 were withdrawn because of protocol violations (e.g., inadvertent administration of a drug with antiemetic properties during surgery), failure to receive the study medication at the appropriate time, or cancellation of the surgical procedure"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the treatment groups were comparable with respect to age, weight, height, history of PONV and motion sickness, day of menstrual cycle, duration of surgery, and PCA morphine usage during the first 72 h postoperatively (tables 1 and 2)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

Study's primary outcome: PONV

Trial registry number: NA

Notes	Study was reported as an interim analysis (for 39 patients out of 170)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "randomised". No other statement on random sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blinded")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blinded")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: in this interim analysis, 39 patients were included. In 5 cases, propofol/TIVA was given instead of inhalational anaesthesia. Results for these 5 women were not included
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a trial registry and no published study protocol
Other bias	High risk	Judgement comment: baseline characteristics (age): no; (weight, ASA): unclear. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker): unclear; (perioperative opioids): yes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the participants were randomly allocated to receive 100 ml of saline (0.9% NaCl) i.v. with or without dixyrazine 10 mg (Esucos 1, UCB, Brussels, Belgium) in accordance with a computer-generated randomization table using sealed envelopes"
Allocation concealment (selection bias)	Unclear risk	Quote: "...using sealed envelopes" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the dixyrazine was diluted by a research nurse and handed over to an anesthesiologist not otherwise involved in the study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all postoperative episodes of nausea, retching and vomiting as well as adverse events occurring within the first 24 h were recorded every 15 min in the PACU and every 2-4 h in the ward by specially trained nurses who were unaware of which treatment each patient had received"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "excluded after the laparoscopic approach had to be switched to laparotomy because of surgical problems. One patient in the placebo group was excluded due to postoperative bleeding"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "besides a small difference in patients' height, which might have been caused by a 20% higher number of males in the placebo group (36 vs. 29), there were no significant differences in demographics and in data related to surgery and anesthesia (Table 1)" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): yes

Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "morphometric and demographic factors, hemodynamic responses, and anesthetic management, including intraoperative fluid regimen and duration of anesthesia, were comparable in all three groups (Table 1). Potential confounding factors, including smoking history, alcohol intake, history of motion sickness and PONV, were also comparable in the three treatment groups" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Gomez Hernandez 2010

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis
Participants	**Baseline characteristics** Placebo • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 35 • *Received treatment (n)*: NA • *Analysed (n)*: 35 • *Age (mean ± SD, median (IQR), median (range))*: 49.89 ± 10.58 • *Weight (mean ± SD, median (IQR), median (range))*: 67.94 ± 9.91 • *BMI (mean ± SD, median (IQR), median (range))*: 27.20 ± 4.29 • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 100 • *Non-smoker (%)*: 94.3 • *History of PONV/motion sickness (%)*: 0 • *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane, N_2O) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 140.71 • *Use of perioperative opioids (if yes, which?)*: 3 to 5 µg/kg fentanyl at induction, postoperative tramadol infusion • *Type of surgery*: radical mastectomy or breast conservative surgery with lymph node axillary dissection Dexamethasone • *Assessed for eligibility (n)*: -

- *Enrolled (n)*: -
- *Randomized (n)*: 35
- *Received treatment (n)*: NA
- *Analysed (n)*: 35
- *Age (mean ± SD, median (IQR), median (range))*: 50.11 ± 12.37
- *Weight (mean ± SD, median (IQR), median (range))*: 69.52 ± 13.63
- *BMI (mean ± SD, median (IQR), median (range))*: 28.20 ± 6.38
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 88.6
- *History of PONV/motion sickness (%)*: 0
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 139.60
- *Use of perioperative opioids (if yes, which?)*: 3 to 5 µg/kg fentanyl at induction, postoperative tramadol infusion
- *Type of surgery*: radical mastectomy or breast conservative surgery with lymph node axillary dissection

Included criteria: undergoing mastectomy with axillary dissection

Excluded criteria: ASA III or IV; older than 80 years of age; pregnancy; active menstruation; treatment with steroids; severe diabetes mellitus (serum HbA1c > 8%); use of opioids, sedatives, or any kind of analgesics less than 1 week before mastectomy; history of alcohol or drug abuse, motion sickness, and/or PONV after any surgical procedure

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): yes

Interventions	**Intervention characteristics** Placebo • *Dose*: saline • *Time point of administration*: 60 minutes before skin incision • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg to 8 mg IV Dexamethasone • *Dose*: 8 mg • *Time point of administration*: 60 minutes before skin incision • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg to 8 mg IV
Outcomes	*Mortality (0 to 7 days)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, observation period unclear)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** this work was supported with financial resources of the participant institutions and in part by a grant of the Health Research Found of the Mexican Institute of Social Security (IMSS, Mexico, D.F.) **Country:** Mexico **Setting:** inpatient, single-centre

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "randomized" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "double-blind" Judgement comment: insufficient information on blinding method
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding method ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...intent-to-treat population), 612 (96%) had no major protocol deviations and were evaluable for efficacy"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a trial registry and no published study protocol available
Other bias	Unclear risk	Quote: "...and were evaluable for efficacy. No statistically significant differences among the treatment groups were observed at baseline for any patient characteristic (Table 1). Overall, the study population was 70% Caucasian and had a mean age of 32 yr. Approximately 25% of the patients had a previous history of PONV. The anesthesia procedures, including use of muscle relaxants, induction, and reversal drugs were statistically comparable among the treatment groups (Table 2). In addition, there were no differences among the groups in concomitant medications or use of postoperative analgesics that would be expected to influence efficacy or safety data. Adverse event data were summarized" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV, perioperative opioids): no; (history of motion sickness, non-smoker): unclear

Identification	**Sponsorship source:** a small project grant from Merck Co. (M.S.G.): "The concept of the project was originated by M.S.G., DO, who served as the Principal Investigator. Merck Co. reviewed the protocol before issuing any funding. Funds received paid for medications administered, research personnel, pharmacy administrative fees, Western IRB fees, and statistical analysis. Merck Co. had no involvement in the analysis of the data or the preparation of the manuscript. The manuscript was reviewed and approved by Merck Co. before submission with no changes made. M.S.G. has received a small project grant from Merck Co. for the completion of this research project. P.G.'s husband has received a small Project grant from Merck Co. for the completion of this Research project" **Country:** USA **Setting:** inpatient and outpatient surgery, single-centre **Author's name:** M.S. Green **Institution:** Department of Anesthesiology, Drexel University College of Medicine, Hahnemann University Hospital, Philadelphia, PA, USA **Email:** michael.green@drexelmed.edu **Address:** Department of Anesthesiology and Perioperative Medicine, 245 North 15th Street, Mail Stop 310, Philadelphia, PA 19102, USA **Language:** English **Duration of study:** NA **Trial registry number:** NCT00717054, NCT00659737 **Study's primary outcome:** complete response (no emesis, no rescue therapy in 24 hours)
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "computer-generated process randomly assigned subjects"
Allocation concealment (selection bias)	Unclear risk	Quote: "using a sealed envelope technique"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Green 2012 *(Continued)*

		Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "depending on the assigned group, the transdermal patch was either a placebo or active medication. All clinicians were blinded to the assigned group"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "trained investigators blinded to the treatment group collected nausea and vomiting information at PACU admission and every 15 min for 1 h, at 2 h, and again at 24 h after operation"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of 120 patients randomized, 119 received study medications and 115 completed the trial. Figure 1 illustrates the patient..." Quote: "prior participation in the study excluded one randomized subject before medication administration. The use of a neuraxial anaesthesia technique after medication administration excluded three patients. One patient had surgery postponed due to an upper respiratory tract infection after medication administration"
Selective reporting (reporting bias)	High risk	Judgement comment: NCT00717054 (prospective registration), NCT00659737 (prospective registration). The prospectively registered primary outcome (PONV within 0 to 24 hours) was changed in the published article (complete response in 0 to 24 hours)
Other bias	Unclear risk	Quote: "the two treatment groups did not differ with regard to patient characteristic variables, including number and type of risk factors, and clinical characteristics (Table 1). The type of surgical procedures did not differ between groups" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, non-smoker, history of PONV/motion sickness): no; (duration of anaesthesia, perioperative opioids): unclear

Grimsehl 2002

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis
Participants	**Baseline characteristics** Cyclizine • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 37 • *Received treatment (n)*: NA • *Analysed (n)*: 37 • *Age (mean ± SD, median (IQR), median (range))*: 31 ± 6 • *Weight (mean ± SD, median (IQR), median (range))*: 66 ± 11 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 100

Grimsehl 2002 *(Continued)*

- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 27/NA
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 26
- *Use of perioperative opioids (if yes, which?)*: 1 µg/kg fentanyl, 7 patients with morphine IV and 16 patients with codeine PO as rescue analgesics
- *Type of surgery*: diagnostic laparoscopy or laparoscopic sterilisation

Ondansetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 37
- *Received treatment (n)*: NA
- *Analysed (n)*: 37
- *Age (mean ± SD, median (IQR), median (range))*: 33 ± 5
- *Weight (mean ± SD, median (IQR), median (range))*: 63 ± 11
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 16/NA
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 25
- *Use of perioperative opioids (if yes, which?)*: 1 µg/kg fentanyl, 9 patients with morphine IV and 19 patients with codeine PO as rescue analgesics
- *Type of surgery*: diagnostic laparoscopy or laparoscopic sterilisation

Included criteria: ASA I and II, written informed consent, scheduled to undergo diagnostic laparoscopy or laparoscopic sterilization

Excluded criteria: NA

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV, perioperative opioids): no; (history of motion sickness, non-smoker): unclear

Interventions	**Intervention characteristics** Cyclizine • *Dose*: 50 mg • *Time point of administration*: at induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 11%, prochlorperazine 12.5 mg IM Ondansetron • *Dose*: 4 mg • *Time point of administration*: at induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 14%, prochlorperazine 12.5 mg IM
Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Vomiting (0 to time to discharge)*

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "randomly assigned by closed envelope technique" Judgement comment: insufficient information on random sequence generation
Allocation concealment (selection bias)	Unclear risk	Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...mg diclofenac suppository was inserted. All assessments were carried out by a blinded investigator, who was unaware of the anti-emetic given. Anaesthetic time was recorded as..."
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "(Research Solutions Ltd, UK). Seventy-four patients were recruited to the study and peri-operative data were obtained for all subjects. Both groups were comparable for..." Judgement comment: at 24-hour follow-up: 12 patients were omitted (did not return questionnaire, required escape antiemetic, inadequate analgesia)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "were prospectively randomized to receive either ondansetron or droperidol in a double-blind..." Judgement comment: no further information on randomization method provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the syringes containing the study medication were prepared by a nurse otherwise not participating in the study" Judgement comment: no further information on blinding of personnel and identical appearance of syringes provided
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "all patients were observed by the same recovery room nurse, who did not otherwise participate in the study. During the following 22 h, the patients were monitored on the general ward by nurses who were familiar with the study" Judgement comment: insufficient information on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "forty patients received ondansetron and 40 received droperidol. All of them completed the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no significant differences between the groups with respect to patient characteristics, type of surgery, duration of anesthesia, and doses of anesthetics (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "...using double blind randomization technique..." Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "using double blind randomization technique, these patients were given either Group A (granisetron 3mg), Group B (ondansetron 4mg) or Group C (metoclopramide 10mg). All the drugs were diluted in 50ml normal saline and given slowly 10 minutes before induction" Judgement comment: insufficient information on blinding
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "investigator who collected post-operative data was blinded to study drug administered while in the recovery ward"
Incomplete outcome data (attrition bias) All outcomes	High risk	Judgement comment: for the outcome "emesis" at the second, third, and fourth time points, patients are missing without reasons stated (> 15%)
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the treatment groups were comparable with regards to patient demographics (Table I)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, history of PONV/motion sickness, perioperative opioids): no; (duration of anaesthesia, non-smoker): unclear

Gupta Priyanka 2014 *(Continued)*

All outcomes		Judgement comment: anaesthesiologist was not blinded but only received information about group allocation at dural closure. Impact on anaesthesia unknown
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "anesthetists who were blinded to group allocation recorded each episode of nausea, retching and vomiting"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "...the study, 25 in each group. There were no significant differences in demographic profile [Table 1], intra-operational characteristics [Table 2], type and anatomical location of intracranial tumors among the three groups [Table 3]. A complete response (no PONV..." Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Gupta Pushplata 2014

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 3 groups, monoprophylaxis and combination prophylaxis
Participants	**Baseline characteristics** Ondansetron • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 25 • *Received treatment (n)*: 25 • *Analysed (n)*: 25 • *Age (mean ± SD, median (IQR), median (range))*: 50.52 ± 12.1 • *Weight (mean ± SD, median (IQR), median (range))*: 59.48 ± 10.63 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 100 • *Non-smoker (%)*: 100 • *History of PONV/motion sickness (%)*: 0 • *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, N_2O) • *Duration of anaesthesia or surgery (in min; as mean or median)*: NA • *Use of perioperative opioids (if yes, which?)*: fentanyl, tramadol (100 mg IV 6-hourly) • *Type of surgery*: modified radical mastectomy Granisetron • *Assessed for eligibility (n)*: -

Habib 2011 *(Continued)*

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "according to a computer-generated random sequence. The randomization assignment was prepared using NQuery Advisor TM version 6.0. A 1:1 assignment ratio was used for treatments, with 65% and 35% assignment to supratentorial and infratentorial strata, respectively. Assignments were balanced using the randomly mixed block size provided by the software"
Allocation concealment (selection bias)	Low risk	Quote: "after patient consent, study personnel faxed a request form to the investigational drug service with the patient study number and site of craniotomy. The randomization sequence was only held by the statistician and the investigational drug service"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "study drugs were prepared by the investigational drug service and supplied in identical blinded form according to a computer-generated random sequence"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "an independent research nurse unaware of the patients' randomization collected the data"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "two hundred three subjects were screened for eligibility; of those, 126 consented to participate in the study. One hundred four patients completed the study: 51 in the aprepitant group and 53 in the ondansetron group (Fig. 1)" Judgement comment: missing data < 15 % and balanced between arms. Reasons described and unrelated to outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT00734929 (retrospective registration)
Other bias	Low risk	Quote: "there was no difference in patient demographics, risk factors for PONV, duration of surgery, intraoperative opioids, and postoperative analgesic consumption between the 2 groups (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Included criteria: ASA I or II, scheduled for breast surgery or abdominal surgery (cholecystectomies and inguinal hernia repairs)

Excluded criteria: NA

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, perioperative opioids): no; (history of PONV/motion sickness): unclear

Interventions

Intervention characteristics

Dexamethasone + ondansetron + droperidol + metoclopramide

- *Dose*: dexamethasone 4 mg, ondansetron 4 mg, droperidol 1.25 mg, metoclopramide 10 mg
- *Time point of administration*: after induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: dixyrazine 5 to 10 mg IV

Control

- *Dose*: none
- *Time point of administration*: -
- *Route of administration*: -

Institution: Department of Anesthesiology, Faculty of Medicine, University of Tokyo, Japan

Email: NA

Address: Department of Anesthesiology, Faculty of Medicine, University of Tokyo, 7-3-1 Hongo, Bunkyo-ku, Tokyo 113-8655, Japan

Duration of study: NA

Language: English

Study's primary outcome: no vomiting rate (defined as the proportion of patients who did not experience vomiting during the 24 hour period after the end of inhalation anaesthesia)

Trial registry number: NA

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "central randomization and minimization" Judgement comment: insufficient information on sequence generation
Allocation concealment (selection bias)	Low risk	Quote: "patients were allocated to intravenous granisetron 3 mg, granisetron 1 mg, or placebo, by central randomization and minimization"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "granisetron was provided as a colorless clear injection, each tube containing 1 mg of granisetron (1.12 mg as granisetron hydrochloride). Placebo injection containing 1 ml of physiological saline appeared identical, to maintain the integrity of the study blinding"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 365 patients who entered the trial, 341 patients received the study medication and were included in population 2: 117 patients in the placebo group, 110 in the granisetron 1-mg group, and 114 in the granisetron 3-mg group. Twenty-six patients were excluded from population 1 due to withdrawal for protocol violations (n 25) or adverse events (n 1; ventricular fibrillation), resulting in a total of 315 patients: 107 patients in the placebo group, 104 in the granisetron 1-mg group, and 104 in the granisetron 3-mg group"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness): no; (history of PONV, non-smoker, perioperative opioids): unclear

Risk of bias

Bias	**Authors' judgement**	**Support for judgement**

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Hechler 2001 *(Continued)*

Random sequence generation (selection bias)	Low risk	Quote: "patients were randomised (according to a computer generated list in the order of their first appearance in the anaesthesia pre-evaluation ambulance) to one of two groups"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "received the same volume of normal saline (NaCl 0.9%) 20 min before the end of anaesthesia in a single-blinded manner" Judgement comment: insufficient information on blinding of personnel
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "after discharge to the ward, every patient was visited once or twice within and 24 h after anaesthesia by one of the authors and interviewed personally" Judgement comment: insufficient information on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "altogether 1348 patients were randomised. Fourteen patients (12 women, 2 men) were dropped from evaluation: 12 because the operative procedure did not achieve the 30 min minimum duration of anaesthesia, and two because the study drug inadvertently had not been injected. Thus, 1334 patients remained for analysis" Judgement comment: reasons for missing outcome data were described and were unrelated to outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the demographic data of the two groups were well matched, as shown in Table 1. In addition, distribution of surgical procedures was not different between the groups (PΩ0.664)" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

- *ASA I/II/III/IV (n)*: 40/3/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 0
- *Type of general anaesthesia*: TIVA (propofol), N_2O
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 75.6
- *Use of perioperative opioids (if yes, which?)*: intraoperative, postoperative fentanyl
- *Type of surgery*: gynaecological laparoscopic procedures

Ondansetron (8 mg PO group)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 46
- *Received treatment (n)*: 46
- *Analysed (n)*: 43
- *Age (mean ± SD, median (IQR), median (range))*: 29.8 ± 6.4
- *Weight (mean ± SD, median (IQR), median (range))*: 55.8 ± 12.4
- *BMI (mean ± SD, median (IQR), median (range))*: 22.7 ± 4.2
- *ASA I/II/III/IV (n)*: 38/5/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 0
- *Type of general anaesthesia*: TIVA (propofol), N_2O
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 77.3
- *Use of perioperative opioids (if yes, which?)*: intraoperative, postoperative fentanyl
- *Type of surgery*: gynaecological laparoscopic procedures

Included criteria: ASA I or II, women 18 to 65 years of age, scheduled for elective gynaecological laparoscopic procedure under general anaesthesia

Excluded criteria: previous history of PONV or motion sickness, had received antiemetic therapy within 24 hours preoperatively, pregnant (except those undergoing medical termination of pregnancy with laparoscopic tubal ligation), receiving opioid and steroid treatment, with body mass index > 30

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Duration of study: March to September 2012

Language: English

Study's primary outcome: incidence of PONV

Trial registry number: NA

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using a block randomisation technique with varying block sizes and serially numbered, sealed envelopes"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...and serially numbered, sealed envelopes. The envelopes were opened in the preoperative area just before administration of the study drug. All the patients were administered two ODFs in the preoperative area by one of the investigators just before shifting to the operating room. Patients in the ODF4 group received one ODF of ondansetron (containing ondansetron 4 mg) plus one placebo ODF, ODF8 group received two ODFs of ondansetron, whereas patients in the placebo and IV groups received two placebo ODFs. The placebo ODFs were formulated by the manufacturer of the ODF of ondansetron to have an identical appearance and flavour. In the operating room, after..."
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "patient to tolerate oral intake. PONV was assessed in two epochs of 0-6 and 7-24 h by an anaesthesiologist who was not involved in administration of the study drugs, intraoperative management, and blinded to the group allocations. An 11-point numerical rating scale..."
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...was considered as significant. One hundred and eighty women were randomised into four groups. Since there was postoperative protocol violation in six patients and one patient received intraoperative methyl ergometrine, they were withdrawn from the study [Figure 1]. Data of 173 patients were analyzed. The patient characteristics, types of..."
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "...of 173 patients were analyzed. The patient characteristics, types of surgical procedure, duration of surgery, duration of anaesthesia, duration of pneumoperitoneum, intraoperative consumption of fentanyl and airway (ETT/PLMA) usage were similar in all the four groups [Table 1]. Postoperative consumption of morphine, time to oral intake, time to first vomit, patient satisfaction score and the incidence of adverse effects were also comparable between

Duration of study: November 2008 to November 2010

Language: English

Study's primary outcome: NA

Trial registry number: NA

Notes	Two out of 3 groups relevant (gabapentin)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using a computer generated randomization method"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "...a computer generated randomization method. Group I received 3 mg iv in a volume of 3 ml 2 minutes before induction of anesthesia; Group II received oral gabapentin 300 mg 1 hour before induction of anesthesia; Group III received placebo. The study drugs were administered by a physician who was not involved in data recording. Data gathering was performed by..." Judgement comment: participants may be aware of group allocation
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...not involved in data recording. Data gathering was performed by a nurse who was not informed from the study group allocation. The standard monitoring included EKG"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the demographic and clinical data including sex, age, BMI, duration of surgery, duration of recovery stay and duration of anesthesia was not significantly different among three groups (P > 0.05) [Table 1]" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, history of motion sickness, duration of anaesthesia): no; (history of PONV, perioperative opioids, non-smoker): unclear

Helmers 1993 *(Continued)*

- *Received treatment (n)*: NA
- *Analysed (n)*: 228
- *Age (mean ± SD, median (IQR), median (range))*: 42.3 ± 8.4
- *Weight (mean ± SD, median (IQR), median (range))*: 65.7 ± 10.0
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (enflurane/isoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 93
- *Use of perioperative opioids (if yes, which?)*: 256.5, 35.6
- *Type of surgery*: abdominal hysterectomy, vaginal hysterectomy, gynaecological laparotomy, other major gynaecological surgery, other surgery

Ondansetron (16 mg group)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: NA
- *Received treatment (n)*: NA
- *Analysed (n)*: 229
- *Age (mean ± SD, median (IQR), median (range))*: 42.8 ± 8.8
- *Weight (mean ± SD, median (IQR), median (range))*: 65.4 ± 11.0
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (enflurane/isoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 90
- *Use of perioperative opioids (if yes, which?)*: 262.7 µg intraoperative fentanyl, 39.2 mg postoperative morphine
- *Type of surgery*: abdominal hysterectomy, vaginal hysterectomy, gynaecological laparotomy, other major gynaecological surgery, other surgery

Included criteria: women, ASA I or II; 18 to 65 years of age; scheduled to undergo gynaecological laparotomy, vaginal hysterectomy, or major vaginal surgery under general anaesthesia

Excluded criteria: evidence of uncontrolled clinically important neurological, renal, hepatic, cardiovascular, metabolic, or endocrine dysfunction or clinically important abnormalities in laboratory screening tests; experienced vomiting or had received an antiemetic 24 hours before administration of the study medication; participated in a clinical study with an unregistered compound within a month of taking part in the study; scheduled to have a nasogastric tube in situ postoperatively; weighed < 45 kg or > 90 kg, pregnant or breastfeeding

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Interventions	**Intervention characteristics**

Placebo

- *Dose*: isotonic saline with citrate buffer
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Helmers 1993 *(Continued)*

- *Rescue antiemetics (if yes, which?)*: metoclopramide or prochlorperazine

Ondansetron (1 mg group)

- *Dose*: 1 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide or prochlorperazine

Ondansetron (8 mg group)

- *Dose*: 8 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide or prochlorperazine

Ondansetron (16 mg group)

- *Dose*: 16 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide or prochlorperazine

Outcomes

Vomiting (0 to 24 hours)

- Outcome type: dichotomous outcome

Nausea (0 to 24 hours)

- Outcome type: dichotomous outcome

Subjects with any AE (0 to 24 hours)

- Outcome type: dichotomous outcome

Headache (0 to 7 days)

- Outcome type: dichotomous outcome

Constipation (0 to 7 days)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 0 to 7 days)

- Outcome type: general notes on side effects

Identification

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: no detailed information on randomization method provided ('randomized')
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: no detailed information on blinding provided ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no detailed information on blinding provided ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: 7 out of 923 patients were excluded with reasons: protocol violations, incorrect surgery, a gastric tube, other prophylactic antiemetics
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no information on a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "randomly allocated to receive..." Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the anaesthetists, nurses and surgeons caring for these patients were blinded to the study drugs"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "anaesthetists, nurses and surgeons caring for these patients were blinded to the study drugs"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 160 patients were entered into the study (40 patients in each group). All patients underwent laparoscopic cholecystectomy under TIVA" Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Helmy 1999 *(Continued)*

Other bias	Unclear risk	Quote: "there were no significant differences between the four study groups with regard to the demographic data, ASA grade, duration of anaesthesia, recovery time, administration of postoperative analgesic drugs or duration of hospital stay (Table 1). Analysis of pre-operative questioning did not show any significant differences with regard to the history of PONV, motion sickness or the incidence of drug allergies" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids, history of PONV/motion sickness): no; (non-smoker): unclear

Outcomes	*Vomiting (0 to 3 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** NA **Country:** Taiwan **Setting:** outpatient, single-centre **Author's name:** R.T. Ho **Institution:** Department of Anesthesiology, Chang Gung Memorial Hospital, 123, Ta-Pei Road, Niao Sung Hsiang, Kaohsiung Hsein, Taiwan, R.O.C. **Email:** NA **Address:** Department of Anesthesiology, Chang Gung Memorial Hospital, 123, Ta-Pei Road, Niao Sung Hsiang, Kaohsiung Hsein, Taiwan, R.O.C. **Duration of study:** NA **Language:** English **Study's primary outcome:** NA **Trial registry number:** NA
Notes	Two out of 4 groups relevant (electro-acupuncture)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "...the end of the procedure. The patients were allocated randomly to one of four groups, each consisting of 25 persons"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Ho 1990 *(Continued)*

		Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Judgement comment: no blinding (different interventions, no treatment in control group)
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the age, weight, and duration of anaesthesia did not differ significantly among the groups (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Honarmand 2012

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis
Participants	**Baseline characteristics** Haloperidol (group H) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 20 • *Received treatment (n)*: NA • *Analysed (n)*: 20 • *Age (mean ± SD, median (IQR), median (range))*: 38.7 ± 15.8 • *Weight (mean ± SD, median (IQR), median (range))*: 66.8 ± 13.8 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: 13/7/0/0 • *Gender (female in %)*: 50 • *Non-smoker (%)*: 75 • *History of PONV/motion sickness (%)*: 15/15 • *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, N_2O) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 214.0

Honarmand 2012 *(Continued)*

- *Use of perioperative opioids (if yes, which?)*: 3 µg/kg fentanyl at induction, intraoperative morphine, 0.05 mg meperidine as rescue analgesic
- *Type of surgery*: middle ear surgery (tympanoplasty or mastoidectomy)

Placebo (group C)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 20
- *Received treatment (n)*: NA
- *Analysed (n)*: 20
- *Age (mean ± SD, median (IQR), median (range))*: 37.3 ± 14.1
- *Weight (mean ± SD, median (IQR), median (range))*: 61.8 ± 13.5
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: 16/4/0/0
- *Gender (female in %)*: 65
- *Non-smoker (%)*: 95
- *History of PONV/motion sickness (%)*: 15/10
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 221.0
- *Use of perioperative opioids (if yes, which?)*: 3 µg/kg fentanyl at induction, intraoperative morphine, 0.01 mg meperidine as rescue analgesic
- *Type of surgery*: middle ear surgery (tympanoplasty or mastoidectomy)

Included criteria: ASA I or II, 18 to 60 years old, scheduled for middle ear surgery (tympanoplasty or mastoidectomy)

Excluded criteria: gastrointestinal tract disease; diabetes mellitus; difficult airway; psychiatric disorder; seizure disorder; Parkinson's disease; previous intolerance to haloperidol administration; nausea and vomiting; obesity (BMI > 35 kg/m^2); QTc interval > 450 ms; received any antiemetics within 24 hours before surgery; allergy to metoclopramide, meperidine, or haloperidol; history of extrapyramidal syndrome or akathisia; pregnancy

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, perioperative opioids, history of PONV/motion sickness): no

Interventions	**Intervention characteristics** Haloperidol (group H) • *Dose*: 2 mg • *Time point of administration*: 30 minutes before conclusion of surgery • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV; 2.5 mg (mean) Placebo (group C) • *Dose*: saline • *Time point of administration*: 30 minutes before conclusion of surgery • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV; 6.5 mg (mean)
Outcomes	*PONV (0 to 24 hours)* • Outcome type: dichotomous outcome *Complete response (no PONV) in 24 hours* • Outcome type: dichotomous outcome

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using a computer generated random number table"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Huang 2001 *(Continued)*

Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "study medications totaled 2 mL, were prepared by one of the investigators and were administered in a double-blind fashion"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...protection. The patients and the investigator who collected the data were blinded to the patient's group"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 120 patients enrolled in this study, three patients who did not complete the surgical procedure (laparoscopic tubal ligation) due to intra-abdominal adhesions and two patients who could not be contacted by telephone after hospital discharge were eliminated from the study. The data obtained from the remaining 115 patients were analyzed"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the patients' characteristics (e.g., age, weight, and height), interval since the last menstrual period and the durations of anesthesia and surgery were similar among the groups (Table I)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Huang 2016

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis and combination prophylaxis
Participants	**Baseline characteristics** Ondansetron (group 2) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 21 • *Received treatment (n)*: NA • *Analysed (n)*: 20 • *Age (mean ± SD, median (IQR), median (range))*: 39.7 ± 5.5 • *Weight (mean ± SD, median (IQR), median (range))*: NA • *BMI (mean ± SD, median (IQR), median (range))*: 22.7 ± 1.2 • *ASA I/II/III/IV (n)*: 13/7/0/0 • *Gender (female in %)*: NA • *Non-smoker (%)*: NA • *History of PONV/motion sickness (%)*: NA • *Type of general anaesthesia*: TIVA (propofol, remifentanil) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 52.4

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using a computer-generated randomization table"
Allocation concealment (selection bias)	Unclear risk	Quote: "on the morning of the surgery, the women were admitted to the obstetrics and gynecology department and assigned into one of the groups by the nurse responsible for the follow-up. In case where a woman changed her mind to participate or receive regional anesthesia, the next woman was assigned into the same group in the same order and received the same protocol number" Judgement comment: insufficient information on allocation concealment
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "patients were blinded to the medication they received" Judgement comment: no further information on blinding of anaesthesiologists
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no information on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 95 women invited to participate, 11 did not participate in the study. Three of them did not want to participate in the study and eight of them changed their mind in the operative theatre and received regional anesthesia"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "demographic data including maternal age, height, weight, body mass index, gravidity, parity, miscarriage, induced abortion, the number of offspring, and the medical history did not show significant differences among the three groups (p [0.05). Table 1 summarizes the comparison of the demographic data of the groups"

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "computer-generated list of random numbers"
Allocation concealment (selection bias)	Unclear risk	Quote: "the syringes were drawn up by a nurse not participating in any other aspect of the study, and labeled with the patient number" Judgement comment: insufficient information to judge whether the investigator could have foreseen allocation of participants to groups
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the syringes were drawn up by a nurse not participating in any other aspect of the study, and labeled with the patient number" Judgement comment: because the nurse who prepared the medication was not participating in any other aspect of the study, we assume blinding of participants and anaesthetists
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "there were no drop-outs"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no significant differences between the groups in preoperative risk factors for nausea (i.e., nonsmoking status, previous travel sickness or post- operative nausea and vomiting) or pain (i.e., preoperative pain, pain or analgesics last week), or in pre- or perioperative medication (data not shown)" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids -> no difference in risk factors reported): unclear

- *Use of perioperative opioids (if yes, which?)*: 1.9 µg/kg intraoperative fentanyl
- *Type of surgery*: breast surgery (mastectomy, tumour biopsy, reductive mastoplasty, other plastic surgery)

Included criteria: females scheduled for breast surgery (mastectomy, tumour biopsy, reductive mastoplasty, other plastic surgery), ASA I or II

Excluded criteria: pre-existing nausea, vomiting, or motion sickness; receiving opioids or drugs with known antiemetic properties in the 24 hours before surgery; history of oesophageal reflux or opioid or alcohol abuse; serum creatinine > 2.0 mg/dL; serum alanine aminotransferase (ALT) or aspartate transaminase (AST) > 2 times the upper limit of normal; body weight twice the ideal body weight

Pretreatment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of motion sickness): no; (history of PONV): unclear

---

Interventions

Intervention characteristics

Placebo

- *Dose*: sugar pills
- *Time point of administration*: 4 hours and 1 hour before induction
- *Route of administration*: PO
- *Rescue antiemetics (if yes, which?)*: NA

Olanzapine (5 mg group)

- *Dose*: 5 mg
- *Time point of administration*: 4 hours before induction of anaesthesia, placebo 1 hour before induction
- *Route of administration*: PO
- *Rescue antiemetics (if yes, which?)*: NA

Olanzapine (10 mg group)

- *Dose*: 10 mg
- *Time point of administration*: 4 hours before induction of anaesthesia, placebo 1 hour before induction
- *Route of administration*: PO
- *Rescue antiemetics (if yes, which?)*: NA

Ondansetron

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomly allocated to one of four groups" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "after a patient was assigned to a treatment group, the assignment was recorded and placed in a sealed envelope by a person not involved in the study. A pharmacist, who was also not involved in the study, prepared the study medications and sealed it in an envelope"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Ibrahim 2013 *(Continued)*

		Judgement comment: it is unclear how the allocation was done
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "to ensure blindness, placebo drug was given in OL5 and OL10 groups 1 h before induction and 4 h before induction in ON16. Placebo group of patients received sugar pills 4 and 1 h before induction" Quote: "a nurse or a physician, who was blinded to the patient treatment groups, gave the study drugs and recorded preoperative and postoperative data" Quote: "a pharmacist, who was also not involved in the study, prepared the study medication and sealed it in an envelope" Quote: "the trial arms in the study were blinded in spite of different olanzapine and ondansetron pharmacokinetics that affect time of drug administration"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "a nurse or a physician, who was blinded to the patient treatment groups, gave the study drugs and recorded preoperative and postoperative data"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "eighty-two patients were included in the study" Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no significant differences in patients' characteristics between treatment groups, including relation of surgery time with stage of menstrual cycle. The mean duration of anesthesia and duration of operation were not different. Also, no significant differences were noted among groups with respect to surgery type (Table 1)" Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of motion sickness): no; (history of PONV): unclear

All outcomes

Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "patients' demographic profile is summarized in Table 1. There was no statistically significant difference between the groups regarding most of their baseline characteristics in the study. The mean age of all patients in this study was 53.93 ± 20.24 years. Of the 151 patients who entered the study, 68 (45%) were male and 83 (55%) were female. The mean duration of anaesthesia in the kytril group was significantly higher than those of biogeneric granisetron and metoclopramide groups (p<0.01)" Judgement comment: baseline characteristics (age): no; (weight, BMI, ASA): unclear. Potential effect modifiers (gender, history of PONV/motion sickness): no; (non-smoker, perioperative opioids): unclear; (duration of anaesthesia): yes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "according to computer-generated random numbers"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "all other study personnel and subjects were blinded to treatment assignment" Judgement comment: anaesthetists were aware of the study drug
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the blinded investigator made the assessments at 30 min intervals after the end of anesthesia until the time of discharge. Patients were contacted again at 24 hours after the operation by an investigator who was unaware of the treatment group"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 159 subjects signed the informed consent. Nine patients who were enrolled were not included in the analysis: three patients who were lost to follow-up for the data collection, one patient enrolled despite the presence of exclusion criteria, one patient withdrawn because of change in anesthetic plan, and four patients withdrawn because of protocol violations in the treatment" Judgement comment: reasons for missing outcome data were described and were unrelated to outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no information on study protocol or trial registry number reported
Other bias	Low risk	Quote: "the demographic characteristics of the remaining 150 patients are shown in Table 1. There were no statistical differences in any of the demographic characteristics. Likewise, there were no differences between groups in relation to the use and dosage of intraoperative analgesics (e.g., fentanyl, mor-

Jin 2013 *(Continued)*

- *Type of surgery*: thyroid tumour surgery

Droperidol (IV group)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 30
- *Received treatment (n)*: NA
- *Analysed (n)*: 30
- *Age (mean ± SD, median (IQR), median (range))*: 46.0 ± 9.8
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 23.6 ± 2.5
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 100
- *History of PONV/motion sickness (%)*: 0/NA
- *Type of general anaesthesia*: TIVA
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 60.0
- *Use of perioperative opioids (if yes, which?)*: 500.0 µg fentanyl intraoperatively
- *Type of surgery*: thyroid tumour surgery

Droperidol (acupoint injection)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 30
- *Received treatment (n)*: NA
- *Analysed (n)*: 30
- *Age (mean ± SD, median (IQR), median (range))*: 44.2 ± 12.4
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 21.9 ± 2.2
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 100
- *History of PONV/motion sickness (%)*: 0/NA
- *Type of general anaesthesia*: TIVA
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 57.5
- *Use of perioperative opioids (if yes, which?)*: 400.0 µg fentanyl intraoperatively
- *Type of surgery*: thyroid tumour surgery

Included criteria: thyroid cancer operation, ASA I to II, female, 20 to 25 years of age, operation duration 120 minutes, no previous smoking, syncope history, signed operation agreement

Excluded criteria: BMI > 25 kg/m^2, pregnancy or breastfeeding, previous PONV, cervical nerve disease, gastritis or ulcus history

Pretreatment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV): no; (history of motion sickness, perioperative opioids): unclear

Interventions	**Intervention characteristics** Placebo • *Dose*: 2 mL NaCl • *Time point of administration*: 30 minutes before anaesthesia • *Route of administration*: IV

	Trial registry number: NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "the study patients were randomly assigned, at an equal ratio" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Low risk	Quote: "the treatment allocation codes were contained in sealed opaque envelopes, and for each consecutive enrolled patient the assisting nurses opened the next envelope in order and prepared the study drug as outlined, but did not participate in the postoperative assessment"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the treatment allocation codes were contained in sealed opaque envelopes, and for each consecutive enrolled patient the assisting nurses opened the next envelope in order and prepared the study drug as outlined, but did not participate in the postoperative assessment"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "all patients were interviewed on the ward by the authors on the first postoperative day up to 24 hours after surgery" Quote: "the treatment allocation codes were contained in sealed opaque envelopes, and for each consecutive enrolled patient the assisting nurses opened the next envelope in order and prepared the study drug as outlined, but did not participate in the postoperative assessment" Judgement comment: insufficient information on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 120 patients participated in the study: 60 patients received tropisetron 5 mg and 60 received droperidol 1.25 mg. One hundred and fifteen patients underwent scheduled laparoscopic cholecystectomy. Five laparoscopies (4%) were finally converted into laparotomy because of technical difficulties (two in the tropisetron group and three in the droperidol group); however, all these patients were included in the analysis. Forty-six patients were studied in Lapland Central Hospital and 74 patients in Oulu University Hospital"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "there were no significant differences between the groups in the demographic data (Table 1). The duration of anaesthesia and surgery were also similar, as well as the doses of intraoperative fentanyl administered" Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Jokela 2000 *(Continued)*

- *Dose*: no treatment
- *Time point of administration*: -
- *Route of administration*: -
- *Rescue antiemetics (if yes, which?)*: 48% (droperidol 0.75 mg IV)

Ondansetron

- *Dose*: 8 mg
- *Time point of administration*: at end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 8% (droperidol 0.75 mg IV)

Outcomes	*Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Complete response (no PONV) in 24 hours* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** NA **Country:** Finland **Setting:** inpatient, multi-centre (2) **Author's name:** Ritva Jokela **Institution:** Department of Anesthesia and Intensive Care,Women's Hospital, University of Helsinki, Helsinki **Email:** Ritva.M.Jokela@hus.fi **Address:** Department of Anesthesia and Intensive Care, Women's Hospital, University of Helsinki, PO Box 140 (Haartmaninkatu 2), FIN-00029 HUS, Finland **Language:** English **Duration of study:** NA **Trial registry number:** NA **Study's primary outcome:** incidence of nausea
Notes	Two out of 3 groups relevant (propofol)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomly assigned to one of three anesthetic treatment groups" Judgement comment: no information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Jokela 2000 *(Continued)*

Blinding of participants and personnel (performance bias) All outcomes	High risk	Judgement comment: no statement on blinding. Due to study design, blinding of anaesthesiologists impossible
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "after 2 hours and 24 hours, the patients were interviewed by a nurse or one of the authors, who were blinded as to the method of anesthesia used"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "the treatment groups were also similar demographically" Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Jokela 2002

- *Type of surgery*: NA

Included criteria: ASA I and II, 18 years of age or older, reported at least 3 of the 5 risk factors

Excluded criteria: recent upper respiratory tract infection; recent use of serotonin antagonists, scopolamine, antiemetic drugs, or psychoactive drugs; hypersensitivity to serotonin antagonists or scopolamine; pregnant

Pretreatment: baseline characteristics (weight): no; (age, ASA): unclear. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids no imbalance in risk factors reported): unclear. "No difference was noted in gender, age, weight, height, ethnic background, or number of risk factors present between groups (Table 1)"

Interventions

Intervention characteristics

Ondansetron

- *Dose*: 4 mg
- *Time point of administration*: placebo at least 2 hours before induction, ondansetron 30 minutes before emergence
- *Route of administration*: placebo transdermal patch, ondansetron IV
- *Rescue antiemetics (if yes, which?)*: 68%

Scopolamine + ondansetron

- *Dose*: scopolamine 1.5 mg over 72 hours, ondansetron 4 mg
- *Time point of administration*: scopolamine at least 2 hours before induction, ondansetron 30 minutes before emergence
- *Route of administration*: scopolamine transdermal patch, ondansetron IV
- *Rescue antiemetics (if yes, which?)*: 29%

Outcomes

Nausea (0 to 24 hours)

- Outcome type: dichotomous outcome

Subjects with any AE (0 to 72 hours)

- Outcome type: dichotomous outcome

Headache (0 to 72 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 72 hours' observation)

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "via a computer-generated randomization process"
Allocation concealment (selection bias)	Low risk	Quote: "they were identical in appearance to the TD scopolamine patches that were purchased for this study and were not in the hospital formulary. The scopolamine patches were designed to deliver 1.5 mg of scopolamine in a time-release manner during 72 hours. The pharmacy generated a random number table and placed the patches in dark plastic bags numbered 1 to 60. All of the patches then were maintained in a secure location by the investigators until subjects were consented and enrolled in the study. The patches were numbered individually before being placed on subjects by the investigators" Judgement comment: central allocation
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "subjects and investigators were unaware of which patch was being placed until the completion of data collection"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "neither the investigators nor the subjects were informed of group assignment until the conclusion of data collection"
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "we enrolled 60 subjects in this double-blind, randomized, placebo-controlled study. A total of 4 subjects were disenrolled, 1 for inadvertent removal of the patch, 1 for incomplete data collection, and 2 for intentional removal of patches secondary to headaches (ondansetron only group). This left a total of 56 subjects with data for analysis (28 in each group)"

Jones 2006 *(Continued)*

		Judgement comment: exclusion of 2 patients after occurrence of headache (headache as outcome of interest)
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "no difference was noted in gender, age, weight, height, ethnic background, or number of risk factors present between groups (Table 1). No significant differences in preoperative, intraoperative, or postoperative analgesic or anxiolytic requirements; volatile agent requirements; or need for reversal from neuromuscular blockade were noted between groups" Judgement comment: baseline characteristics (weight): no; (age, ASA): unclear. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids no imbalance in risk factors reported): unclear

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "a computerized randomization list was generated, and identical syringes..."

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Joo 2016 *(Continued)*

Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "by personnel not involved in the study, according to the list"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "every episode of nausea or vomiting was recorded during the first 2 hours after surgery, and the presence of nausea at 2 hours after surgery was asked by a member of the nursing staff who was blinded to the study drug used"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "among 120 patients recruited, 12 patients were excluded because they did not meet inclusion criteria; they showed ASA physical status >2. Another three patients were excluded because they did not agree to participate. Hence, 105 were randomly allocated to three groups. Among 16 follow-up loss patients, three patients and 13 patients did not respond to 24 hours and 48 hours telephone call, respectively (Fig. 1)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: KCT0000688 (retrospective registration)
Other bias	Low risk	Quote: "there were no significant differences in patients' characteristics, Apfel's four risk factors for PONV (female gender, nonsmoking, prior history of motion sickness or PONV, and the use of intraoperative opioids) [14], and the duration of surgery and anesthesia among the groups (Table 1)..." Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Kaja 2014 *(Continued)*

- *History of PONV/motion sickness (%)*: 0
- *Type of general anaesthesia*: balanced anaesthesia (N_2O, inhalational agents, fentanyl)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 87.67
- *Use of perioperative opioids (if yes, which?)*: anaesthesia with fentanyl (2 µg/kg); 6 patients received tramadol for postoperative pain
- *Type of surgery*: major abdominal surgeries (most common surgeries were laparotomy, cholecystectomy, and abdominal hysterectomy)

Included criteria: ASA I and II, hospitalized, 18 to 60 years of age; scheduled for major abdominal surgery under general anaesthesia

Excluded criteria: gastrointestinal (GI) disease, such as hiatus hernia, gastro-oesophageal regurgitation disorder, peptic ulcer disease, and autonomic dysfunction disorder, pregnant and lactating women; renal, hepatic, or neurological impairment; any antiemetic medication within 24 hours before surgery; history of motion sickness, PONV in previous surgery or vomiting; Ryle's tube in situ in the last 24 hours

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (gender, non-smoker): unclear

---

Interventions

Intervention characteristics

Ramosetron (group I)

- *Dose*: 0.3 mg
- *Time point of administration*: before extubation
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: ramosetron 0.3 mg IV

Ondansetron (group II)

- *Dose*: 4 mg
- *Time point of administration*: before extubation
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: ramosetron 0.3 mg IV

Outcomes

Vomiting (0 to 24 hours)

- Outcome type: dichotomous outcome

Vomiting (2 to 6 hours)

- Outcome type: dichotomous outcome

Complete response (no PONV) in 24 hours

- Outcome type: dichotomous outcome

Subjects with any SAE (0 to 24 hours)

- Outcome type: dichotomous outcome

Extrapyramidal symptoms (0 to 1 hour, 1 to 2 hours, 2 to 6 hours, 6 to 24 hours)

- Outcome type: dichotomous outcome

Headache (0 to 1 hour, 1 to 2 hours, 2 to 6 hours, 6 to 24 hours)

- Outcome type: dichotomous outcome

Sedation/drowsiness (0 to 1 hour, 1 to 2 hours, 2 to 6 hours, 6 to 24 hours)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "randomization was achieved by using a sealed envelope technique prepared by an independent personnel" Judgement comment: insufficient information on sequence generation
Allocation concealment (selection bias)	Unclear risk	Quote: "ten minutes prior to the end of anesthesia, randomization was achieved by using a sealed envelope technique prepared by an independent personnel" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "the anesthesia was performed by an anesthesiologist not involved in the before or after operation patient care" Judgement comment: anaesthesiologist was not blinded
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "an independent research assistant who was unaware of the patients' randomization collected all data"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 78 patients were enrolled in the study. Three patients were excluded from the study, one patient in group M, after the laparoscopic approach was changed to laparotomy for surgical reasons, and 2 patients; one in placebo group for after surgery complications (surgical), and one in group O, due to improper selection"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there was no significant intergroup difference in the patient demographic data, ASA classification, or surgical time"

Kakuta 2011 *(Continued)*

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomized into two groups" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Judgement comment: control group without placebo treatment. Anaesthesiologists and participants were not blinded
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "sixty four total patients were enrolled, but only 60 patients participated in the study. Four patients withdrew due to either changes in the surgical procedure from laparoscopic to laparotomy, changes in anaesthesia to propofol, and one patient decided not to receive aprepitant after enrolling"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: JPRN-UMIN000003850 (prospective registration). Frequency of PONV was prespecified as primary outcome in the protocol. The definition of primary and secondary outcomes in the final study report remained unclear
Other bias	High risk	Quote: "to receive aprepitant after enrolling. Thirty patients were in each group and the mean ages for the control group and NK1 group were insignificant at 38 and 35 years, respectively. There were no significance between patient height or weight and both groups had relatively similar ASA physical states and risk factors for PONV (Table 1). Furthermore, patients in both groups had similar menstrual cycle phases. All patients tolerated aprepitant without any adverse effects. Surgical/anesthetic values throughout the procedure also remained insignificant between control and NK1 groups (Table 2). Duration of anesthesia, length of procedure, patient blood loss, and infused fluid volume were all similar. Additionally, similar doses of remifentanil and rocuronium were used in both groups. PONV incidence at acute phase" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): yes

Duration of study: NA

Trial registry number: NA

Study's primary outcome: meperidine consumption

Notes	Two out of 3 groups relevant (fentanyl)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using computer-generated random numbers"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the patient, anesthesiologist, and observers collecting data were blinded to the patient's study group allocation"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the patient, anesthesiologist, and observers collecting data were blinded to the patient's study group allocation"
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	Quote: "two patients were excluded from the study after randomization because of epidural analgesia failure" Judgement comment: 2 patients were excluded after randomization according to study authors, but data for all patients (n = 90) are reported
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker): unclear; (perioperative opioids): yes

Khalil 1994 *(Continued)*

- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 28/NA
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 59.9
- *Use of perioperative opioids (if yes, which?)*: alfentanil or fentanyl during anaesthesia
- *Type of surgery*: gynaecological, orthopaedic, peripheral, ear/nose/throat/oral, eye, abdominal

Ondansetron (8 mg group)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 144
- *Received treatment (n)*: NA
- *Analysed (n)*: 129
- *Age (mean ± SD, median (IQR), median (range))*: 32.5 ± 0.7
- *Weight (mean ± SD, median (IQR), median (range))*: 65.5 ± 1.1
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 28/NA
- *Type of general anaesthesia*: inhalational anaesthesia (N_2O, isoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 60.5
- *Use of perioperative opioids (if yes, which?)*: alfentanil or fentanyl during anaesthesia
- *Type of surgery*: gynaecological, orthopaedic, peripheral, ear/nose/throat/oral, eye, abdominal

Included criteria: healthy women, 18 to 70 years or age, ASA I or II, scheduled for elective outpatient surgical procedure

Excluded criteria: pregnant; more than 100% over ideal body weight; had received a tricyclic antidepressant, phenothiazine, antiemetic, H2 antagonist, or corticosteroid within 24 hours of the study; pre-study serum alanine aminotransferase (ALT) concentrations greater than twice the upper limit of normal, serum creatinine concentration > 2.0 mg/mL; scheduled for liver surgery or biopsy; required gastric suction via intragastric tube intraoperatively or postoperatively; history of emesis or retching within 24 hours before receiving the study drug

Pretreatment: potential effect modifiers (gender, duration of anaesthesia, history of PONV): no; (history of motion sickness, non-smoker, perioperative opioids): unclear

Khalil 1994 *(Continued)*

Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "patients were randomized". No further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Judgement comment: quote: "all ondansetron doses were diluted with placebo to a volume of 8 ml and then further diluted with normal saline (0.9% NaCl) to a total volume of 20 ml to maintain the blinded design of the study"; "the study drug was then administered IV in a double-blind fashion"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: quote: "in the PACU an independent blinded observer recorded..."
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: quote: "a total of 589 patients were enrolled in the trial. An efficacy subgroup was created by excluding patients with protocol violations which may have affected efficacy results. Forty patients were excluded from the efficacy analysis of the initial 2-h study period, and an additional 10 patients were dropped from the 24-h analysis"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: quote: "there was no difference between treatment groups in ethnic origin, weight, age, height, days since last menstrual period, or previous anaesthetic experience" Baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV): no; (history of motion sickness, non-smoker, perioperative opioids): unclear

- *Type of general anaesthesia*: inhalational anaesthesia (N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 107.10 ± 8.12
- *Use of perioperative opioids (if yes, which?)*: fentanyl 3 µg/kg before induction and 1 µg/kg to 2 µg/kg during anaesthesia
- *Type of surgery*: laparoscopic abdominal surgery

Included criteria: either sex, ASA I or II, 20 to 60 years of age, scheduled for laparoscopic abdominal surgery

Excluded criteria: gastrointestinal disease; history of postoperative nausea and vomiting (PONV); history of motion sickness; had received opioids, antiemetics, steroids, or NSAIDs; had hypersensitivity to any of the 3 drugs

Pretreatment: baseline characteristics (weight, ASA): no; (age): yes. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

---

Interventions

Intervention characteristics

Placebo (group P)

- *Dose*: 5 mL saline
- *Time point of administration*: just before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 40% (ondansetron 4 mg)

Granisetron + droperidol (group GDr)

- *Dose*: granisetron 3 mg, droperidol 1.25 mg
- *Time point of administration*: just before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 0% (ondansetron 4 mg)

Granisetron + dexamethasone (group GDx)

- *Dose*: granisetron 3 mg, dexamethasone 8 mg
- *Time point of administration*: just before induction of anaesthesia
- *Route of administration*: IV

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Khan 2008 *(Continued)*

- *Rescue antiemetics (if yes, which?)*: 0% (ondansetron 4 mg)

Dexamethasone + droperidol (group DxDr)

- *Dose*: dexamethasone 8 mg, droperidol 1.25 mg
- *Time point of administration*: just before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 7.5% (ondansetron 4 mg)

Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Complete response (no PONV) in 24 hours* • Outcome type: dichotomous outcome *Extrapyramidal symptoms (0 to 24 hours)* • Outcome type: dichotomous outcome *Headache (0 to 24 hours)* • Outcome type: dichotomous outcome *Constipation (0 to 24 hours)* • Outcome type: dichotomous outcome *Sedation/drowsiness (0 to 24 hours)* • Outcome type: dichotomous outcome

Khan 2008 *(Continued)*

Random sequence generation (selection bias)	Low risk	Quote: "orally on the night before surgery. Patients were randomly allocated to one of the four groups using a computer generated table of random numbers. Group P: Patients received 5ml"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "combination with droperidol 1.25 mg. The study medications were prepared by the technician in identical syringes and in equal volume to make the study double blind. Neither the patient nor the observer was aware of the medication received by the patient. A standard protocol for general anesthesia" Judgement comment: anaesthetists were not blinded
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "neither the patient nor the observer was aware of the medication received by the patient"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "the treatment groups were comparable with regards to patient demographics and types of operation. A complete response was observed" Judgement comment: baseline characteristics (weight, ASA): no; (age): yes. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Ondansetron (8 mg group)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 20
- *Received treatment (n)*: 20
- *Analysed (n)*: 20
- *Age (mean ± SD, median (IQR), median (range))*: 42 ± 13
- *Weight (mean ± SD, median (IQR), median (range))*: 58 ± 11
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 20/NA
- *Type of general anaesthesia*: inhalational anaesthesia (N_2O, enflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 110
- *Use of perioperative opioids (if yes, which?)*: NA
- *Type of surgery*: breast surgery

Included criteria: fibroadenoma, undergoing breast resection, ASA I or II

Excluded criteria: receiving tranquilizing/sedative or antiemetic drugs within 24 hours before surgery; respiratory disease; hepatologic disease; pregnancy; need or demand PCA

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness): no; (history of PONV, non-smoker, perioperative opioids): unclear

Interventions	**Intervention characteristics** Placebo • *Dose*: 20 mL • *Time point of administration*: within 5 minutes before anaesthesia

- *History of PONV/motion sickness (%)*: 1.85/33.33
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 105
- *Use of perioperative opioids (if yes, which?)*: 2 µg/kg to 3 µg/kg fentanyl at induction, 466 µg postoperative fentanyl via PCA
- *Type of surgery*: gynaecological surgery (hysterectomy, ovarian cystectomy, salpingo-oophorectomy)

Placebo

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 54
- *Received treatment (n)*: NA
- *Analysed (n)*: 54
- *Age (mean ± SD, median (IQR), median (range))*: 41 ± 9.1
- *Weight (mean ± SD, median (IQR), median (range))*: 57 ± 8.7
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 87.04
- *History of PONV/motion sickness (%)*: 5.6/42.6
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 114
- *Use of perioperative opioids (if yes, which?)*: 2 µg/kg to 3 µg/kg fentanyl at induction, 375 µg postoperative fentanyl via PCA
- *Type of surgery*: gynaecological surgery (hysterectomy, ovarian cystectomy, salpingo-oophorectomy)

Included criteria: female, 21 to 71 years of age, undergoing elective gynaecological surgery (hysterectomy, ovarian cystectomy, salpingo-oophorectomy), duration of surgery 35 to 190 minutes

Excluded criteria: pregnancy; body weight > 30% above ideal body weight; vomiting or retching within 24 hours before the operation; administration of antiemetics or steroids or psychoactive medications within 24 hours before the operation; respiratory, cardiovascular, renal, hepatic, endocrine, gastrointestinal, or neurological disease

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear, but stated "healthy patients". Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): yes

Interventions

Intervention characteristics

Ramosetron

- *Dose*: 0.3 mg
- *Time point of administration*: 30 minutes before end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg, second ondansetron 4 mg

Ondansetron

- *Dose*: 8 mg
- *Time point of administration*: 30 minutes before end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg, second ondansetron 4 mg

Placebo

- *Dose*: saline

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were randomly allocated to receive one of the three study medications according to a computer-generated randomized number table"
Allocation concealment (selection bias)	Unclear risk	Quote: "the envelopes were opened before induction of anaesthesia by a trained nurse not involved in the study. The nurse then prepared..."

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Kim 2009 *(Continued)*

		Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the envelopes were opened before induction of anaesthesia by a trained nurse not involved in the study. The nurse then prepared the appropriate study medication diluted..."
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all patients, investigators collecting the post-operative data, and nurses involved in the postoperative care of patients were blinded to the randomization"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "no study patient was withdrawn from the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "there were no significant differences among the three groups with respect to patient characteristics, type of surgery, duration of surgery or anaesthesia, motion sickness, smoking status, or previous PONV history (Table 1)" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear, but stated "healthy patients". Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): yes

- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 100
- *History of PONV/motion sickness (%)*: 100
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 153.6
- *Use of perioperative opioids (if yes, which?)*: 872 µg remifentanil intraoperative, fentanyl postoperative
- *Type of surgery*: laparoscopic surgery

Palonosetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 36
- *Received treatment (n)*: NA
- *Analysed (n)*: 36
- *Age (mean ± SD, median (IQR), median (range))*: 54.3 ± 10.5
- *Weight (mean ± SD, median (IQR), median (range))*: 65.6 ± 9.0
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 100
- *History of PONV/motion sickness (%)*: 100
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 169.9
- *Use of perioperative opioids (if yes, which?)*: 905 µg remifentanil intraoperative, fentanyl postoperative
- *Type of surgery*: laparoscopic surgery

Included criteria: ASA I or II, female, 20 to 65 years of age, non-smoker, history of motion sickness or previous PONV, elective laparoscopic surgery, use of postoperative intravenous patient-controlled analgesia (IV-PCA) with fentanyl

Excluded criteria: impairment of bowel motility, diabetes, pregnancy or lactation, administration of an antiemetic medication or steroids within 24 hours before surgery, presence of a cardiovascular or respiratory disease, obesity (body mass index > 35 kg/m^2), renal or hepatic dysfunction

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions

Intervention characteristics

Ondansetron

- *Dose*: 4 mg
- *Time point of administration*: before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: (54.3%) 20 mg propofol, 10 mg metoclopramide, 4 mg ondansetron, 4 mg dexamethasone

Kim SH 2013 *(Continued)*

	Ramosetron • *Dose*: 0.3 mg • *Time point of administration*: before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: (34.2%) 20 mg propofol,10 mg metoclopramide, 4 mg ondansetron, 4 mg dexamethasone Palonosetron • *Dose*: 75 µg • *Time point of administration*: before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: (11.1%) 20 mg propofol, 10 mg metoclopramide, 4 mg ondansetron, 4 mg dexamethasone
Outcomes	*Headache (0 to 48 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** NA **Country:** Korea **Setting:** inpatient, single-centre **Author's name:** Hae Keum Kil **Institution:** Department of Anesthesiology and Pain Medicine, Anesthesia and Pain Research Institute, Yonsei University College of Medicine, Seoul, Korea **Email:** hkkil@yuhs.ac **Address:** Department of Anesthesiology and Pain Medicine, Anesthesia and Pain Research Institute, Severance Hospital, Yonsei University College of Medicine, 134, Sinchon-dong, Seodaemun-gu, Seoul 120-752, Korea **Duration of study:** July 2010 to June 2011 **Language:** English **Study's primary outcome:** PONV (nausea, vomiting, need for rescue medication) **Trial registry number:** NCT01169805 (not referenced in the published study report)
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using computer-generated random numbers"
Allocation concealment (selection bias)	Low risk	Quote: "the hospital pharmacy that prepared the study drugs assigned patients into one of 3 active treatment groups on the morning of the day of surgery"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Kim SH 2013 *(Continued)*

Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all patients, surgeons, anaesthesiologists, and nurses involved in the study were blinded to group allocation and every precaution was taken to maintain the double-blind conditions"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "postoperative nausea and emetic episodes were assessed for 48 hours after surgery by 2 independent investigators blinded to patient group"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "no patient withdrew from the study"
Selective reporting (reporting bias)	High risk	Judgement comment: NCT01169805 (prospective registration). One additional new primary outcome was added to the final study report (need to use a rescue medication). The assessment period was shortened in the study report
Other bias	Low risk	Quote: "neither patient characteristics nor intraoperative data differed among the 3 groups (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Institution: Department of Anaesthesiology and Pain Medicine, College of Medicine, Chung-Ang University, Seoul, Republic of Korea

Email: roman00@cau.ac.kr

Address: Department of Anaesthesiology and Pain Medicine, Chung-Ang University College of Medicine, 224-1 Heukseok-dong, Dongjak-gu, Seoul 156-755, Republic of Korea

Language: English

Duration of study: January to September 2012

Trial registry number: ACTRN12612000757819

Study's primary outcome: primary endpoint of this study was severity of PONV

Notes	Two out of 3 groups relevant (midazolam)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the randomization was based on a random table, generated using the R Project for Statistical Computing (http://www. r-project.org/) Block randomization with a block size of four and equal allocation was employed to prevent imbalances in treatment assignments. The randomization sequence was generated by a statistician who was not involved with the study"
Allocation concealment (selection bias)	Unclear risk	Quote: "the randomization sequence was generated by a statistician who was not involved with the study. Patient group allocation was revealed to the anaesthetist immediately prior to induction of anaesthesia, by means of numbered and sealed envelopes" Quote: "participate in conducting the study and data collection" Quote: "decisions to enrol or exclude patients were made by an investigator at the preoperative anaesthetic evaluation who did not otherwise..." Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "patient group allocation was revealed to the anaesthetist immediately prior to induction of anaesthesia" Judgement comment: anaesthesiologists were not blinded
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "patients were questioned by an anaesthetic nurse, who was unaware of the group identities, as to the severity of nausea and incidence of retching and vomiting"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 100 patients were enrolled in the study; four patients were excluded because of incomplete data collection and two patients were excluded because of withdrawal of consent"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: ACTRN12612000757819 (retrospective registration). Date of study start given in the protocol differs from that given in the study report
Other bias	Unclear risk	Quote: "patient characteristics and operative data were similar in the three groups (Table 1)"

- *Use of perioperative opioids (if yes, which?)*: 0.5 mg/kg meperidine IV (PACU), 1 mg/kg meperidine IV (every 6 hours)
- *Type of surgery*: caesarean section

Included criteria: ASA I or II, scheduled for caesarean section

Excluded criteria: underlying pro-emetic disease and/or taking antiemetic drugs

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions	**Intervention characteristics** Placebo (group A) • *Dose*: 5 mL saline • *Time point of administration*: immediately after clamping of the umbilical cord

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Kocamanoglu 2005 *(Continued)*

- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 26.7% (metoclopramide 10 mg IV)

Granisetron + dexamethasone (group B)

- *Dose*: granisetron 40 µg/kg, dexamethasone 8 mg
- *Time point of administration*: immediately after clamping of the umbilical cord
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 0.0% (metoclopramide 10 mg IV)

Granisetron + droperidol (group C)

- *Dose*: granisetron 40 µg/kg, droperidol 1.25 mg
- *Time point of administration*: immediately after clamping of the umbilical cord
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 3.3% (metoclopramide 10 mg IV)

Droperidol (group D)

- *Dose*: 1.25 mg
- *Time point of administration*: immediately after clamping of the umbilical cord
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 16.7% (metoclopramide 10 mg IV)

Granisetron (group E)

- *Dose*: 40 µg/kg
- *Time point of administration*: immediately after clamping of the umbilical cord
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 3.3% (metoclopramide 10 mg IV)

Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Vomiting (0 to 3 hours)* • Outcome type: dichotomous outcome *Vomiting (3 to 24 hours)* • Outcome type: dichotomous outcome *PONV (0 to 24 hours)* • Outcome type: dichotomous outcome *Subjects with any SAE (0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "prospectively and randomly assigned to one of five groups". No further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Judgement comment: quote: "total volume of antiemetic solutions were 5 ml with the saline added, and thus maintaining the anesthesiologist blinding to the study drug"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: quote: "one of the investigators, who were blinded to the treatment group, recorded all the variables observed"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "sampling technique was done by permuted block randomization. Ratio between treatment group (combination of metoclopramide and dexamethasone) and control group (metoclopramide) was 1:1. 'A' represented treatment group, and 'B' represented control group. Then 'Block of four' randomization was performed by a hospital pharmacist who prepared the drugs. This pharmacist was not involved in patient care or data collection. Accordingly, the 'Block of four' could be distributed into six blocks including 1) AABB, 2) ABAB, 3) ABBA, 4) BBAA, 5) BABA, and 6) BAAB, respectively. The labeled num-

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the treatment allocation codes, produced from a table of random digits"
Allocation concealment (selection bias)	Low risk	Quote: "the treatment allocation codes, produced from a table of random digits, were contained in numbered sealed opaque envelopes"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "for each new patient, the assisting nurse opened the next envelope in numerical order and prepared the study drug as outlined but did not take part in the anaesthetic or in the postoperative assessment. The randomised process and the identity of the study drugs were blinded from the anaesthetist throughout the study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all observations were recorded without knowledge of the treatment given"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 63 patients participated in the study and underwent scheduled laparoscopic cholecystectomy. Thirty-one patients received ondansetron and 32 placebo" Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Koivuranta 1996 *(Continued)*

Other bias	High risk	Quote: "there were no essential differences between the groups in age, body mass index, previous history of PONV and history of migraine (Table 1). There were, however, more male patients in the placebo group than in the on-dansetron group and a history of motion sickness was more common in the ondansetron group. The duration of anaesthesia and surgery were similar in both groups" Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV): no; (non-smoker, perioperative opioids): unclear; (history of motion sickness): yes

Koivuranta 1997

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the patients were randomised by a research nurse using a table of random permuted blocks of 20 numbers (13)"
Allocation concealment (selection bias)	Unclear risk	Quote: "...of 20 numbers (13) with the treatment codes put into sealed envelopes. For each consecutive recruited patient, the assisting nurses opened the next envelope in order, prepared the study drug but did not participate in the postoperative assessment. The drugs were masked from the participating physicians by dilution to the same volume of saline. Anaesthesia was standardised" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "put into sealed envelopes. For each consecutive recruited patient, the assisting nurses opened the next envelope in order, prepared the study drug but did not participate in the postoperative assessment. The drugs were masked..."
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all observations were made without the interviewer being aware of the study treatment..."
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 439 patients entered and all of them completed the study on planned schedule: 195 patients received ondansetron, 193 droperidol and 51 placebo"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "193 droperidol and 51 placebo. The treatment groups were fairly comparable as to some demographic and clinical characteristics (Table 1). However, some disparity appeared in the prognostic factors for PONV. There were more patients in the ondansetron group with a history of migraine and with a history of previous postoperative sickness than in the other groups. The duration of anaesthesia and surgery were similar in all groups. The treatment groups were also comparable with regard to the type of surgery performed (Table 1). Overall, 203 of the patients..." Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV (10% difference)/motion sickness): no; (perioperative opioids): unclear

Koivuranta 1999 *(Continued)*

- *Enrolled (n)*: -
- *Randomized (n)*: NA
- *Received treatment (n)*: 45
- *Analysed (n)*: 45
- *Age (mean ± SD, median (IQR), median (range))*: 42 (21 to 62)
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 23.5 (18.2 to 34.5)
- *ASA I/II/III/IV (n)*: 33/11/1/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 67
- *History of PONV/motion sickness (%)*: 100/51
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 95
- *Use of perioperative opioids (if yes, which?)*: 300 µg fentanyl intraoperative, 24.6 mg oxycodone post-operative
- *Type of surgery*: gynaecological laparoscopic surgery

Droperidol + tropisetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: NA
- *Received treatment (n)*: 43
- *Analysed (n)*: 43
- *Age (mean ± SD, median (IQR), median (range))*: 38 (25 to 51)
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 24.0 (17.1 to 37.5)
- *ASA I/II/III/IV (n)*: 33/10/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 79
- *History of PONV/motion sickness (%)*: 100/35
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 70
- *Use of perioperative opioids (if yes, which?)*: 250 µg fentanyl intraoperative, 25.6 mg oxycodone post-operative
- *Type of surgery*: gynaecological laparoscopic surgery

Included criteria: female, history of previous PONV, scheduled to have elective gynaecological laparoscopic surgery, over 18 years of age, ASA I to III

Excluded criteria: pregnant, breastfeeding, evidence of hepatic or other metabolic dysfunction, Parkinson's disease, currently received opioids or medication with antiemetic activity

Pretreatment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, perioperative opioids, non-smoker, history of PONV/motion sickness): no; (duration of anaesthesia): yes

Interventions	**Intervention characteristics** Droperidol + ondansetron • *Dose*: droperidol 0.75 mg, ondansetron 8 mg • *Time point of administration*: droperidol after induction of anaesthesia, ondansetron at the end of the procedure • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 31% (droperidol 0.75 mg)

Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "gender and investigative site. Of 518 patients enrolled, 517 were included in safety analyses (one patient withdrew from the study after randomization but before receiving study drug), and 514 were included in the intent-to-treat data set for efficacy analyses (3 patients were withdrawn from the study before cessation of anesthesia: two experienced serious adverse events not related to study drug during surgery and one patient required nasogastric suction during and after surgery). There were no statistically..."
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no statistically significant imbalances across treatment groups with respect to gender, race, age, previous surgery, ASA physical status, history of POW, or history of motion sickness. There was a statistically but not clinically significant imbalance in weight among treat- ment groups (P=0.004), with patients in the ondansetron group weighing less on average than patients in the other treatment groups (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, history of PONV/motion sickness): no; (non-smoker, duration of anaesthesia, perioperative opioids): unclear

Kovac 1992 *(Continued)*

Included criteria: ASA I or II; non-pregnant female; between 18 and 70 years of age; scheduled for diagnostic laparoscopy, laparoscopy for tubal sterilization, or laparoscopy including laser surgery; intubated with an endotracheal tube and received a balanced anaesthetic

Excluded criteria: > 100% over ideal body weight, scheduled to undergo liver or peritoneal biopsy during the laparoscopy, to undergo continuous gastric suction via an intragastric tube during the surgical procedure, received any antiemetic medication within the 24 hours before surgery, had received an investigational drug within 30 days of the study

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV): no; (history of motion sickness, non-smoker, perioperative opioids): unclear

Interventions

Intervention characteristics

Placebo

- *Dose*: citrate puffer
- *Time point of administration*: infused over 5 minutes, before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 27% (droperidol, prochlorperazine, metoclopramide, promethazine)

Ondansetron (1 mg group)

- *Dose*: 1 mg
- *Time point of administration*: infused over 5 minutes, before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 21% (droperidol, prochlorperazine, metoclopramide, promethazine)

Ondansetron (4 mg group)

- *Dose*: 4 mg
- *Time point of administration*: infused over 5 minutes, before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 12% (droperidol, prochlorperazine, metoclopramide, promethazine)

Ondansetron (8 mg group)

- *Dose*: 8 mg
- *Time point of administration*: infused over 5 minutes, before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 11% (droperidol, prochlorperazine, metoclopramide, promethazine)

Outcomes

Complete response (no PONV) in 24 hours

- Outcome type: dichotomous outcome

Subjects with any AE (0 to 24 hours)

- Outcome type: dichotomous outcome

Headache (0 to 24 hours)

- Outcome type: dichotomous outcome

Sedation/drowsiness (0 to 24 hours)

- Outcome type: dichotomous outcome

Identification	**Sponsorship source:** sponsored by Helsinn Healthcare SA and supported by MGI PHARMA **Country:** Germany, Poland, Czech Republic **Setting:** inpatient, multi-centre (28 centres in Europe: 13 in Germany, 10 in Poland, and 5 in the Czech Republic) **Author's name:** Giuseppina Clerici **Institution:** Research and Development Department, Helsinn Healthcare SA, Lugano, Switzerland **Email:** gcl@helsinn.com **Address:** P.O. Box 357, 6915 Pambio-Noranco (Lugano), Switzerland **Language:** English **Duration of study:** NA **Trial registry number:** NA **Study's primary outcome:** complete response (CR: no emesis and no use of rescue medications) evaluated at 0 to 24 and 24 to 72 hours after surgery
Notes	None
Risk of bias	

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Kovac 2008 *(Continued)*

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "treatment randomization was stratified by type of surgery, history of PONV, and smoking status. A dynamic adaptive stratification type of randomization method was used to balance the four treatment groups across the entire study and not within each individual site"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "at each study site, palonosetron and placebo were prepared for administration to patients by an unblinded research pharmacist or designee who was otherwise not involved in the conduct of the study"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: emetic episodes and nausea were assessed with patient's reported diary cards. No statement on assessment of adverse events
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "significance level of 0.05. The incidence rates for adverse events were summarized; formal statistical comparisons were not performed. After the first 130 patients were enrolled in this study, a potential unblinding event with the clinical supplies label was discovered by a representative of the sponsor. If the labels were closely examined, there was a remote possibility that unblinding information of palonosetron versus placebo could have been revealed to the pharmacist. However, neither patient nor investigator was likely unblinded and the dose of palonosetron could not have been revealed. The decision was made to exclude these 130 patients and enroll an additional 130 patients to replace them. For this reason, the first 130 patients were included in the safety analysis (n 673) but excluded from the efficacy analysis (n 544)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, non-smoker, history of PONV/motion sickness, perioperative opioids): no; (duration of anaesthesia): unclear

Koyuncu 2017 *(Continued)*

All outcomes		opaque plastic to keep the surgical team and anesthesiologists blinded to treatment"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all postoperative measurements were conducted by a research assistant who was blinded to group allocation"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT02296333 (retrospective registration)
Other bias	High risk	Quote: "the two randomized groups were poorly balanced on duration of anesthesia and duration of surgery, with absolute standardized differences of 0.66 and 0.70, respectively (Table 1). We thus adjusted for each when comparing the two groups on outcomes" Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear; (duration of anaesthesia): yes

Kranke 2012

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 5 groups, monoprophylaxis, dose-finding study
Participants	**Baseline characteristics** Placebo • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 51 • *Received treatment (n)*: 51 • *Analysed (n)*: 50 • *Age (mean ± SD, median (IQR), median (range))*: 51.2 (20 to 76) • *Weight (mean ± SD, median (IQR), median (range))*: NA • *BMI (mean ± SD, median (IQR), median (range))*: 27.1 (18.1 to 40.9) • *ASA I/II/III/IV (n)*: NA • *Gender (female in %)*: 88.2 • *Non-smoker (%)*: NA • *History of PONV/motion sickness (%)*: NA • *Type of general anaesthesia*: inhalational anaesthesia (desflurane, isoflurane, or sevoflurane) • *Duration of anaesthesia or surgery (in min; as mean or median)*: NA • *Use of perioperative opioids (if yes, which?)*: all patients except 1 received opioids • *Type of surgery*: hysterectomy, other laparoscopic surgery, breast surgery Buspirone (0.3 mg group) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: -

Kranke 2012 *(Continued)*

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "by means of an interactive telephone- and internet-based randomisation service, the site obtained a randomised treatment allocation for each subject to one of five groups"
Allocation concealment (selection bias)	Low risk	Quote: "the site obtained a randomised treatment allocation for each subject to one of five groups: 0.3, 1, 2 or 3 mg of buspirone or placebo" Quote: "the randomisation was stratified by country and by number of risk factors (2 vs. 3 or 4). An unblinded pharmacist at each site, with no other study involvement, made up a treatment syringe of equal volume (28 ml) containing placebo or the appropriate dose of buspirone for each subject. Syringes were matching and were labelled with the randomisation number only to ensure that allocation was concealed" Judgement comment: central allocation
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...and that the investigators, other study personnel, and subjects were all blinded as to treatment group" Quote: "syringes were matching and were labelled with the randomisation number only to ensure that allocation was concealed and that the investigators, other study personnel and subjects were all blinded as to treatment group"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "patients were asked prospectively by blinded dedicated research assistants about nausea every 30 min after surgery up to and including the 1-h mark and then again at 6 and 24 h"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "in total, 298 patients were screened and 281 were randomised into the study (Fig. 1). Twenty-four patients did not receive the study drug, mostly because their operation was cancelled or postponed (11 cases), the study drug was unavailable (5 cases) or they withdrew consent prior to surgery (5 cases). This left 257 patients"
Selective reporting (reporting bias)	Low risk	Judgement comment: NCT00895830 (prospective registration). The prospectively registered primary outcome (PONV) was reported in the prespecified way in the final study report
Other bias	Unclear risk	Quote: "primary safety and efficacy analyses. Study arms were well balanced for age, sex, body mass index and race (Table 1). The mean age of patients at enrolment was 50.6 years, and 89.9% were female. There were no significant differences between study arms in terms of past medical history, baseline physical examination, vital signs and type of operation. Hysterectomy occurred in 22.6% of patients, laparoscopic surgery other than hysterectomy or cholecystectomy in 19.8%, and breast surgery in 14.4%. There were no significant differences between study arms in terms of anaesthetic technique. All patients except one received opioids, and 93% received a volatile anaesthetic (desflurane, isoflurane or sevoflurane). Among the few who did..." Judgement comment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

Address: Department of Anaesthesia and Critical Care, University Hospital of Würzburg, Oberdürrbacher Str. 6, Würzburg 97080, Germany

Duration of study: January to April 2012

Language: English

Study's primary outcome: PONV (vomiting/retching or antiemetic rescue) in the 24 hour period after surgery.

Trial registry number: NCT01510704, EUCTR2011-004267-71

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "an internet-based randomization system provided sites on demand with a subject number for each patient randomized"
Allocation concealment (selection bias)	Low risk	Quote: "an internet-based randomization system provided sites on demand with a subject number for each patient randomized, which could then be matched to the subject number on the appropriate vial of study medication held at the site" Judgement comment: central allocation (web-based)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all vials were identically labelled except for an individual subject number derived from a master randomization list available to the contract manufacturer of the study medication, but not to the sponsor, any site research personnel, or study participants"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the final constitution of study analysis populations was determined on a fully blinded basis before database closure"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "two hundred and twenty-three subjects were randomized into the study (Fig. 1), eight not receiving study drug, mostly because of withdrawal of consent, cancellation of surgery, or a preoperative episode of nausea and vomiting. The ITT and safety analysis populations, therefore, comprised 215 individuals"
Selective reporting (reporting bias)	Low risk	Judgement comment: NCT01510704 (prospective registration), EUCTR2011-004267-71 (prospective registration). The prospectively registered primary outcome (PONV) was reported in the pre-specified way in the final study report
Other bias	Unclear risk	Quote: "therefore, comprised 215 individuals. Study arms were generally well balanced for age, body mass index, and PONV risk factor profile (Table 1). Most patients were female (92%) and non-smokers (77%), including ex-smokers who had ceased 2 yr previously. Two-thirds of the population had three or four risk factors. There were no significant differences" Judgement comment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, non-smoker, history of PONV/motion sickness, perioperative opioids): no; (duration of anaesthesia): unclear

	Duration of study: NA **Trial registry number:** NA **Study's primary outcome:** incidence of PONV
Notes	(Erratum appears in Journal of the Medical Association of Thailand 2008 Jul;91(7):1154. Note: dosage error in text)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Judgement comment: quote: "a randomization list and sealed envelopes were prepared before anaesthesia according to a list of randomized numbers generated by the method of block randomization, with block size varying from 2 to 6"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Judgement comment: quote: "according to the list, identical syringes containing each antiemetic were prepared by a nurse anaesthetist not involved in the study. In this way, the anaesthesiologist, anaesthetist, patients, and PACU nurses were all blinded to the identity of the prophylactic treatment"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: quote: "according to the list, identical syringes containing each antiemetic were prepared by a nurse anaesthetist not involved in the study. In this way, the anaesthesiologist, anaesthetist, patients, and PACU nurses were all blinded to the identity of the prophylactic treatment"; "the details of any other adverse effects were recorded by a nurse anesthetist, not apprised of which drug had been administered"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: quote: "two patients in the ondansetron group were excluded from the trial due to complications in surgery (final operations were bowel surgery)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Kumar 1996

Study characteristics

Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis
Participants	**Baseline characteristics** Ondansetron • *Assessed for eligibility (n)*: - • *Enrolled (n)*: -

- *Type of surgery*: laparoscopic cholecystectomy

Included criteria: both sexes, scheduled for elective laparoscopic cholecystectomy

Excluded criteria: older than 60 years and younger than 18 years, smoker, alcoholics, history of hypersensitivity to any drug, impaired liver and kidney functions, history of previous PONV, receiving antidepressants or calcium channel blockers, converted to open cholecystectomy

Pretreatment: baseline characteristics (age, weight, ASA): unclear. Potential effect modifiers (non-smoker, history of PONV): no; (gender, duration of anaesthesia, history of motion sickness, perioperative opioids): unclear

---

Interventions

Intervention characteristics

Placebo (group I)

- *Dose*: 2 ml of distilled water
- *Time point of administration*: before general anaesthesia administered
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV

Ondansetron (group II)

- *Dose*: 4 mg
- *Time point of administration*: before general anaesthesia administered
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV

Dexamethasone (group III)

Kurz 2015 *(Continued)*

- *BMI (mean ± SD, median (IQR), median (range))*: 28 ± 7
- *ASA I/II/III/IV (n)*: 41/160/71/0
- *Gender (female in %)*: 52
- *Non-smoker (%)*: 73
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: balanced anaesthesia (des-/sevoflurane, fentanyl)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 204
- *Use of perioperative opioids (if yes, which?)*: 0.48 mg fentanyl intraoperative, postoperative morphine/hydromorphone
- *Type of surgery*: colorectal resection

Included criteria: adults younger than 80 years of age, scheduled for elective colorectal resection expected to last 2 to 6 hours

Excluded criteria: chemotherapy within 6 months, anticipated secondary wound closure, fever (≥ 38°C) or infection at admission, severe chronic obstructive pulmonary disease (forced expiratory volume in the first second (FEV1)/forced vital capacity (FVC) 70%; FEV1 150% predicted, with or without chronic symptoms), unstable angina pectoris, hypertensive cardiomyopathy, congestive heart failure (according to the Modified Framingham criteria), myocardial infarction within 6 months, bowel obstruction (confirmed or suspected by the primary surgeon), ASA ≥ 4

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness): unclear; (perioperative opioids, non-smoker): yes

Interventions	**Intervention characteristics** Dexamethasone • *Dose*: 4 mg • *Time point of administration*: within 15 minutes of induction • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: not standardized, ondansetron recommended, dexamethasone forbidden Placebo • *Dose*: saline 0.9% • *Time point of administration*: within 15 minutes of induction • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: not standardized, ondansetron recommended, dexamethasone forbidden
Outcomes	*Vomiting (PACU)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** this study was supported in part by the Gheens Foundation (Louisville, KY, USA) and the Mater College for Postgraduate Research (Ireland). Viasys Healthcare (Wheeling, IL, USA) provided the Hi-Ox oxygen masks **Country:** USA, Austria, Ireland, Switzerland **Setting:** inpatient, multi-centre (5) **Authors name:** D.I. Sessler **Institution:** Department of Outcomes Research, Cleveland Clinic, Cleveland, OH, USA **Email:** ds@or.org

Kurz 2015 *(Continued)*

	Address: NA **Language:** English **Duration of study:** 2002 to 2007 **Trial registry number:** NCT00273377 **Study's primary outcome:** incidence of surgical site infection within 30 days
Notes	Factorial trial design (normocapnia and hypercapnia)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "all assignments were based on computer-generated randomizations"
Allocation concealment (selection bias)	Low risk	Quote: "all assignments were based on computer-generated randomizations that were kept in opaque, sealed, sequentially numbered envelopes until shortly before surgery"
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "anaesthesiologists were not blinded to group assignments, but flow meters and gas monitors were shielded to prevent surgeons from determining randomisation"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "after giving the handoff report to the post-anaesthesia care unit, the anaesthesia record was sealed in an envelope as part of the blinding process until discharge" Quote: "wounds were evaluated daily throughout hospitalisation by an investigator blinded to treatment. Subsequently subjects were called on the 15th and 30th day and a scripted interview was used to enquire about SSI. When answers suggested that infection was likely, efforts were made to obtain relevant records. An investigator blinded to treatment adjudicated infections and complications using all available data"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "≤ 0.05 were retained. We enrolled 586 subjects in five centres (Bern, 29; Cleveland, 295; Dublin, 29; Louisville, 102; Vienna, 131); data from 555 subjects were analysable (Fig. 1)..."
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT00273377 (retrospective registration)
Other bias	High risk	Quote: "clinical characteristics, diagnoses, surgical procedures, duration of surgery, haemodynamic values, and anaesthetic management were generally similar in subjects randomized to each intervention. However, an open surgical approach was used slightly more often in subjects assigned to 80% rather than 30% inspired oxygen, and subjects assigned to dexamethasone were given slightly more fentanyl and volatile anaesthesia (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness): unclear; (perioperative opioids, non-smoker): yes

- *Use of perioperative opioids (if yes, which?)*: fentanyl at induction 1 µg/kg
- *Type of surgery*: gynaecological laparoscopic procedures

Included criteria: female; ASA I or II; 28 to 58 years of age; with (n = 84) or without (n = 84) history of motion sickness; undergoing gynaecological laparoscopic procedures including salpingo-oophorectomy, oophorectomy, salpingostomy, myomectomy, tubal ligation, and diagnostic laparoscopy

Excluded criteria: pregnant; obese (body mass index > 30 kg/m^2); current smoker; needing long-term steroid therapy; diagnosed with gastrointestinal, liver, or renal dysfunction; vestibular disease; preoperative vomiting; currently receiving antiemetic therapy

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of motion sickness, perioperative opioids): no; (history of PONV): unclear

Interventions	**Intervention characteristics** Dexamethasone (group MS+) • *Dose*: 8 mg • *Time point of administration*: immediately before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV Placebo (group MS+) • *Dose*: saline 2 ml • *Time point of administration*: immediately before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV Dexamethasone (group MS-) • *Dose*: 8 mg • *Time point of administration*: immediately before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV Placebo (group MS-) • *Dose*: saline 2 ml • *Time point of administration*: immediately before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV
Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Vomiting (0 to 2 hours, 0 to 6 hours)* • Outcome type: dichotomous outcome

Lee 2003 *(Continued)*

Vomiting (6 to 12 hours)

- Outcome type: dichotomous outcome

Nausea (0 to 24 hours)

- Outcome type: dichotomous outcome

Complete response (no PONV) in 24 hours

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Identification	**Sponsorship source:** NA **Country:** Taiwan **Setting:** inpatient, single-centre **Author's name:** Yi Lee **Institution:** Department of Anesthesiology, Tzu-Chi Medical Center, Hualien, Taiwan, R.O.C **Email:** drleeyi@sinamail.com **Address:** Department of Anesthesiology, Tzu-Chi Medical Center, No. 707, Sec. 3, Chung-Yang Road, Hualien, Taiwan, R.O.C. **Duration of study:** NA **Language:** English **Study's primary outcome:** incidence of PONV **Trial registry number:** NA
Notes	Four groups (participants with or without history of motion sickness) pooled into 2 groups for analysis

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients with or without motion sickness history (designated MS+ and MS- groups, respectively) were randomly assigned to one of two treatment regimens" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the study medications (2 mL) were prepared by personnel blinded to the study protocols, and were administered intravenously immediately prior to the induction of anesthesia"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all data were collected by a team of trained nurse anesthetists blinded to the type of treatment received"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Lee 2003 *(Continued)*

Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 168 patients enrolled, four were excluded from the analysis: two required further surgery (laparotomy) during the procedure and two were lost to follow-up"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "no additional opioid drugs were administered during the operation" Quote: "except for history of motion sickness, no significant differences were demonstrated between patient groups when comparing demographic data, duration of surgery, CO2 insufflation and anesthesia (Table I)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of motion sickness, perioperative opioids): no; (history of PONV): unclear

- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 34.29
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA/0
- *Type of general anaesthesia*: inhalational anaesthesia
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 254.4
- *Use of perioperative opioids (if yes, which?)*: fentanyl via epidural infusor
- *Type of surgery*: subtotal gastrectomy

Included criteria: ASA I or II, diagnosed with cancer of the stomach, undergoing elective subtotal gastrectomy

Excluded criteria: recent use of opioids; any cutaneous pathology with pruritus; administration of antiemetic medication within 24 hours before surgery; history of motion sickness, convulsion, parkinsonism, or psychiatric problems; inability to answer questions

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness): no; (history of PONV, non-smoker, perioperative opioids): unclear

Interventions

Intervention characteristics

Placebo

- *Dose*: saline
- *Time point of administration*: on surgical commencement of skin closure
- *Route of administration*: epidural
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg or ondansetron 4 mg IV

Droperidol

- *Dose*: 2.5 mg
- *Time point of administration*: on surgical commencement of skin closure
- *Route of administration*: epidural
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg or ondansetron 4 mg IV

Outcomes

Arrhythmia (0 to 48 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 48 hours' observation)

- Outcome type: general notes on side effects

Lee 2006 *(Continued)*

Duration of study: March 2000 to October 2001

Language: English

Study's primary outcome: incidence of PONV and pruritus

Trial registry number: NA

Notes	Two out of 3 groups relevant (continuous infusion of droperidol)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were randomly allocated to one of the following three groups (n 40 each) according to a random-number table"
Allocation concealment (selection bias)	Unclear risk	Quote: "an independent pharmacist prepared three sets of 10 mL syringe and infusions (Infusor LV5; Baxter Healthcare Corp., USA) according to the Group A, B and C and these sets were kept concealed in numbered envelopes and all study personnel and participants were blinded to treatment assignment for the duration of the study" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all study personnel and participants were blinded to treatment assignment for the duration of the study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the severity of pruritus, PONV, pain and sedation were evaluated by an anaesthesiologist who was blinded to the study treatments at 1, 6, 24 and 48 h postoperatively"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "twelve patients were excluded. An epidural catheter could not be placed in seven patients for technical reasons and patient discomfort preoperatively, therefore epidural analgesia was placed postoperatively. In three patients who have shown far advanced gastric cancer during operation, gastrojejunostomy was performed instead of a gastrectomy. There were missing data from two patients. Data from the remaining 108 patients were analysed"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "all groups were demographically similar, and there were no differences in epidural levels or surgery duration (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness): no; (history of PONV, non-smoker, perioperative opioids): unclear

Lee 2014 *(Continued)*

- *Received treatment (n)*: NA
- *Analysed (n)*: 30
- *Age (mean ± SD, median (IQR), median (range))*: 53.2 ± 9.2
- *Weight (mean ± SD, median (IQR), median (range))*: 57.3 ± 6.7
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 97
- *History of PONV/motion sickness (%)*: 0/26.7
- *Type of general anaesthesia*: TIVA (propofol, remifentanil), N_2O
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 87.5
- *Use of perioperative opioids (if yes, which?)*: intraoperative remifentanil
- *Type of surgery*: breast and thyroid cancer

Included criteria: women aged 20 to 65 years, scheduled to undergo general anaesthesia for breast and thyroid cancer surgery, ASA I or II

Excluded criteria: history of severe cardiovascular or respiratory distress, morbid obesity, drug or alcohol abuse, history of adverse medication reactions and chronic pain, had received any antiemetics, sedatives, or analgesics within 24 hours before surgery, if we could not get intravenous access to the desired vein on the dorsum of the hand apart from the surgical field

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Interventions	**Intervention characteristics** Placebo (group S) • *Dose*: saline • *Time point of administration*: after venous occlusion at the forearm • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg or ondansetron 4 mg IV Palonosetron (group P) • *Dose*: 75 µg • *Time point of administration*: after venous occlusion at the forearm • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg or ondansetron 4 mg IV
Outcomes	*Extrapyramidal symptoms (0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** NA **Country:** Korea **Setting:** inpatient, single-centre **Author's name:** Ji Heui Lee **Institution:** Department of Anesthesiology and Pain Medicine, Korean Cancer Center Hospital, Seoul, Korea

Duration of study: NA

Language: English

Study's primary outcome: reduction in pain scores

Trial registry number: NA

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomly allocated to one of two groups by the investigator using a sealed envelope system" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "using a sealed envelope system" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "all syringes of the pretreatment drugs were prepared by an anesthetic nurse under the supervision of the investigator" Judgement comment: no information on blinding of participants and anaesthesiologists
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "12 and 24 hours after surgery, a blinded researcher assessed allergic reactions, edema, pain at the injection site, PONV, shivering, VAS, and the use of rescue antiemetics and analgesics" Quote: "a blinded nurse assessed the patients in the PACU"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "all 60 patients completed the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no significant differences between the two groups with regard to age, body" Quote: "2014 palonosetron and injection pain weight, height, duration of surgery, and risk factors including history of PONV, motion sickness, non-smoking, and type of surgery (Table 1). The overall incidence of pain..." Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

- *Randomized (n)*: 40
- *Received treatment (n)*: 40
- *Analysed (n)*: 40
- *Age (mean ± SD, median (IQR), median (range))*: 41 ± 8
- *Weight (mean ± SD, median (IQR), median (range))*: 57 ± 8
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 0
- *Type of general anaesthesia*: TIVA
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 105
- *Use of perioperative opioids (if yes, which?)*: 2.5 ng/mL to 3.5 ng/mL remifentanil intraoperative (target blood concentration, total amount of intraoperative remifentanil per group not reported), 2 patients received pethidine as rescue analgesia
- *Type of surgery*: gynaecological laparoscopy

Included criteria: women, ASA I or II, 18 to 60 years of age, undergoing general anaesthesia for gynaecological laparoscopy

Excluded criteria: gastrointestinal disease, history of motion sickness, previous episode of PONV, menstruating, had taken an antiemetic medication within 24 hours before surgery

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (non-smoker, perioperative opioids): unclear

Interventions	**Intervention characteristics** Control • *Dose*: saline, placebo • *Time point of administration*: IV immediately after induction of anaesthesia, PO 1 hour before surgery • *Route of administration*: IV/PO • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV, ondansetron 4 mg IV, dexamethasone 5 mg IV Ramosetron (IV group) • *Dose*: 0.3 mg • *Time point of administration*: ramosetron immediately after induction of anaesthesia, placebo 1 hour before surgery • *Route of administration*: IV (ramosetron)/PO • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV, ondansetron 4 mg IV, dexamethasone 5 mg IV Ramosetron (PO group) • *Dose*: 0.1 mg • *Time point of administration*: ramosetron 1 hour before surgery, placebo immediately after induction of anaesthesia • *Route of administration*: PO (ramosetron)/IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV, ondansetron 4 mg IV, dexamethasone 5 mg IV
Outcomes	*Headache (0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)*

- Outcome type: general notes on side effects

Identification	**Sponsorship source:** this study was supported by Gil Medical Center, Incheon, Korea **Country:** Korea **Setting:** inpatient, single-centre **Author's name:** H.J. Kwak **Institution:** Department of Anesthesiology and Pain Medicine, Gil Medical Center **Email:** NA **Address:** Gachon University of Medicine and Science, 1198 Guwol-dong, Namdong-gu, Incheon 405-760, Korea **Duration of study:** NA **Language:** English **Study's primary outcome:** incidence of complete response (no nausea, no retching, no vomiting) **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "effects on postoperative nausea 47 0.3 mg IV ramosetron (IV group), or 0.1 mg oral ramosetron (PO group), using a sealed envelope system. An independent researcher prepared..." Quote: "patients were allocated randomly to one of three groups (n = 40 in each), to receive saline (control group)" Judgement comment: insufficient information on random sequence generation (shuffling envelopes?)
Allocation concealment (selection bias)	Unclear risk	Quote: "...using a sealed envelope system. An independent researcher prepared the study solutions, which consisted of a drinking cup containing 10 ml saline and a syringe with 2 ml normal saline in the control group, a cup containing 10 ml saline and a syringe with 0.3 mg ramosetron in the IV group, and a cup containing completely dissolved ramosetron tablets in 10 ml saline and a syringe with 2 ml saline in the PO group. The oral test drug..." Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the oral test drug was administered 1 hour before surgery and the IV test drug was injected immediately after the induction of anaesthesia by an investigator who was blinded to the study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all episodes of PONV (nausea, retching, and vomiting) during the periods 0 to 1 hour and 1 to 24 hours after anaesthesia were recorded by nursing staff who were unaware of which treatment each patient had been given"
Incomplete outcome data (attrition bias)	Low risk	Judgement comment: no missing outcome data

Lee DC 2011 *(Continued)*

- *History of PONV/motion sickness (%)*: 12/22
- *Type of general anaesthesia*: TIVA (propofol, remifentanil)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 240
- *Use of perioperative opioids (if yes, which?)*: intraoperative remifentanil, 601.7 µg fentanyl via PCA
- *Type of surgery*: total thyroidectomy

Included criteria: female, 18 to 65 years of age, scheduled for total thyroidectomy, non-smoking status, anticipated to require postoperative opioids

Excluded criteria: severe bowel motility impairment, insulin-dependent diabetes mellitus, pregnancy, breastfeeding, administration of an antiemetic before surgery, systemic treatment with steroids before surgery, history of cardiovascular or respiratory disease, impaired renal and/or hepatic function

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Interventions

Intervention characteristics

Control (group C)

- *Dose*: saline
- *Time point of administration*: 20 minutes before end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV

Ramosetron (group R)

- *Dose*: 0.3 mg
- *Time point of administration*: 20 minutes before end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV

Outcomes

Vomiting (0 to 6 hours)

- Outcome type: dichotomous outcome

Vomiting (6 to 24 hours)

- Outcome type: dichotomous outcome

Headache (0 to 48 hours)

- Outcome type: dichotomous outcome

Sedation/drowsiness (0 to 48 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were randomly allocated to either a control group (n = 65) or a ramosetron group (n = 65) using a computerized generated randomization table"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "injected drugs were prepared in identical syringes by personnel not otherwise involved in this study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "these variables were assessed by investigators unaware of the group identities"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "patients' characteristics, including a history of PONV and/or motion sickness, and operative data were similar in both groups (Table 1), as were the expected risks for PONV using the Apfel scoring system [13]" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Lee IH 2007 *(Continued)*

- *History of PONV/motion sickness (%)*: NA/0
- *Type of general anaesthesia*: inhalational anaesthesia (enflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 250
- *Use of perioperative opioids (if yes, which?)*: 2 µg/kg fentanyl at induction, postoperatively via PCA
- *Type of surgery*: surgical resection for colorectal cancer

Included criteria: ASA I and II, underwent surgical resection for colorectal cancer under general anaesthesia combined with epidural anaesthesia

Excluded criteria: recent use of opioids; any cutaneous pathology with pruritus; administration of antiemetic medication within 24 hours before surgery; history of motion sickness, convulsion, parkinsonism, or psychiatric problems; inability to answer questions; could not tolerate the preoperative epidural procedure because of pain or discomfort; epidural failure; dural puncture

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness): no; (history of PONV, non-smoker, perioperative opioids): unclear

Interventions	**Intervention characteristics** Control • *Dose*: placebo • *Time point of administration*: at skin closure • *Route of administration*: epidural • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg or ondansetron 4 mg IV Droperidol • *Dose*: 2.5 mg • *Time point of administration*: at skin closure • *Route of administration*: epidural • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg or ondansetron 4 mg IV
Outcomes	*Arrhythmia (0 to 48 hours)* • Outcome type: dichotomous outcome *Extrapyramidal symptoms (0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** NA **Country:** Korea **Setting:** inpatient, single-centre **Author's name:** Il Ok Lee **Institution:** Department of Anesthesiology, Cheil General Hospital, and Women's Healthcare Center, Kwandong University College of Medicine, Seoul, Korea; and Department of Anesthesiology, Korea University College of Medicine, Seoul, Korea. **Email:** iloklee@korea.ac.kr **Address:** Department of Anesthesiology, Guro Hospital, Guro gu Gurodonggil 97, Korea University College of Medicine, Seoul, South Korea

Lee IH 2007 *(Continued)*

	Duration of study: June 2000 to October 2001 **Language:** English **Study's primary outcome:** incidence of pruritus **Trial registry number:** NA
Notes	Two out of 4 groups relevant (continuous infusion of droperidol)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "according to a random-number table"
Allocation concealment (selection bias)	Unclear risk	Quote: "an independent pharmacist prepared four sets of 10 mL syringes and infusions (Infusor LV5; Baxter Healthcare, USA) for Groups A, B, C, and D. These sets were kept concealed in numbered envelopes" Judgement comment: not stated; "sequentially numbered, opaque. and sealed envelopes" (SNOSE). Syringes and infusions are not stated as identical
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the participants and researchers were blinded as to group assignment"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the severity of pruritus, PONV, pain, and sedation were evaluated at 1, 6, 24,and 48 hours postoperatively by an anaesthesiologist who was blinded to the study treatments"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "eighteen patients were excluded from the study. An epidural catheter could not be placed in eight patients because of technical reasons and preoperative patient discomfort; therefore, an epidural catheter was placed postoperatively. Five patients were excluded because of epidural failure (catheter dislocation in two patients and dural puncture in three patients). There were missing data from five patients. The data from the remaining 142 patients were analyzed"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "all the groups were demographically similar, and there were no differences in the epidural levels or the duration of surgery (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness): no; (history of PONV, non-smoker, perioperative opioids): unclear

Lee SY 2002 *(Continued)*

- *Dose*: 0.9% NaCl
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 31.7% (metoclopramide 10 mg)

Granisetron

- *Dose*: 20 µg/kg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 11.1% (metoclopramide 10 mg)

Ramosetron

- *Dose*: 4 µg/kg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 19.4% (metoclopramide 10 mg)

Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Subjects with any AE (0 to 24 hours)* • Outcome type: dichotomous outcome *Headache (0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomly allocated to receive placebo (0.9% NaCl), granisetron 20 µg/kg or ramosetron 4 µg/kg i.v." Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: no statement
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "specially trained nurses performed the questioning, and they were blinded to study groups"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Lee WS 2015

Study characteristics

Lee Y 2004 *(Continued)*

- *Dose*: 4 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 31.6% (metoclopramide 10 mg IV)

Dexamethasone (2 mg group)

- *Dose*: 2 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 47.2% (metoclopramide 10 mg IV)

Placebo

- *Dose*: 0.9% saline
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 45.7% (metoclopramide 10 mg IV)

Outcomes

Vomiting (0 to 24 hours)

- Outcome type: dichotomous outcome

Vomiting (0 to 2 hours)

- Outcome type: dichotomous outcome

Vomiting (2 to 12 hours)

- Outcome type: dichotomous outcome

Nausea (0 to 24 hours)

- Outcome type: dichotomous outcome

Complete response (no PONV) in 24 hours

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

	Trial registry number: NA
Notes	Five out of 6 groups relevant (continuous infusion of droperidol via PCA)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using a computer-generated random number table"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all patients were blinded to the nature of the drug administered. The study medication preparations were performed by a specially trained nurse-anaesthetist who was not involved in any subsequent assessments"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...recorded by specially trained nurse anaesthetists who were blinded as to the treatment groups"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 240 patients were recruited. Among these patients, 20 were later withdrawn for comparisons for the following reasons: 2 patients in the droperidol group experienced excessive drowsiness and PCA had to be discontinued; 2 patients underwent further surgery within 24 h; 6 patients had difficult intubation; and 10 patients had inadequate follow-up. The remaining 220 patients completed this study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "patient characteristics, surgical types, duration of anaesthesia, and numbers of risk factors for PONV (12), including prior PONV, motion sickness, and nonsmokers, were similar in the 6 groups (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

- *Rescue antiemetics (if yes, which?)*: NA

Dexamethasone + ondansetron (DS group)

- *Dose*: dexamethasone 10 mg, ondansetron 8 mg (sevoflurane)
- *Time point of administration*: dexamethasone before anaesthetic induction, ondansetron 30 minutes before end of surgical procedure
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Outcomes	*PONV (0 to 24 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** NA **Country:** China **Setting:** inpatient, single-centre **Author's name:** Zhi-yi Fan **Institution:** Key Laboratory of Carcinogenesis and Translational Research (Ministry of Education), Department of Anesthesiology, Peking University Cancer Hospital Institute, Beijing, China **Email:** 13911114196@163.com **Address:** Key Laboratory of Carcinogenesis and Translational Research (Ministry of Education), Department of Anesthesiology, Peking University Cancer Hospital Institute, Beijing 100142, China **Duration of study:** NA **Language:** Chinese (Google Translator) **Study's primary outcome:** NA **Trial registry number:** NA
Notes	Four groups divided into 2 sub-studies (2 different anaesthesia regimens: TIVA, inhalational anaesthesia): Li 2015-1 and Li 2015-2

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "randomized". No further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: no statement
Blinding of outcome assessment (detection bias)	Unclear risk	Judgement comment: no statement

- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 159
- *Use of perioperative opioids (if yes, which?)*: intraoperative fentanyl/morphine/hydromorphone
- *Type of surgery*: hysterectomy

Included criteria: female; older than 18 years of age; fluent in English language; scheduled for inpatient elective hysterectomy requiring general anaesthesia of at least 30 minutes' duration; ASA I, II, or III

Excluded criteria: positive urine or serum pregnancy test done within 7 days of the study; currently breastfeeding; undergoing concomitant bowel surgery other than appendectomy; known hypersensitivity to the study medication (aprepitant) or to any of the antiemetic rescue medications (ondansetron, hydroxyzine, or promethazine), level of preoperative nausea > 4 on the visual rating scale (VRS); severe hepatic insufficiency as determined by a Child-Pugh score > 9 or any condition that impaired the patient's ability to complete study assessments; currently taking rifampin, carbamazepine, and phenytoin and other drugs that strongly induce CYP3A4 activity; had used antiemetics within 12 hours before surgery; history of clinically significant abuse of substances (alcohol, illicit, or prescribed medications) such that the patient was unable to provide informed consent or to reliably complete any of the study assessments; history of a psychiatric illness that may impair the patient's ability to provide informed consent or to complete any of the study assessments

Pretreatment: baseline characteristics (age not for all participants, weight, ASA): unclear. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

Interventions	**Intervention characteristics** Aprepitant + dexamethasone + ondansetron • *Dose*: aprepitant 40 mg, dexamethasone 8 mg, ondansetron 4 mg • *Time point of administration*: aprepitant 30 minutes before induction of anaesthesia, dexamethasone at induction of anaesthesia, ondansetron within 15 minutes of end of surgery • *Route of administration*: aprepitant PO, dexamethasone + ondansetron IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV, promethazine 12.5 mg IV/PO/IM/PR, hydroxyzine 25 mg IV/PO/IM; in PACU at discretion of the anaesthesiologist

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "computerized random number generator was used to create the treatment allocation schedule, which was stored by the pharmacy"
Allocation concealment (selection bias)	Unclear risk	Quote: "which was stored by the pharmacy"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Long 2014 *(Continued)*

		Judgement comment: schedule was stored by the pharmacy, but no information on whether it remained concealed or who was aware of this schedule, and how study medication was prepared
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "subjects received either oral aprepitant 40 mg or oral placebo approximately 30 minutes prior to induction of standardized anesthesia" Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "there were 125 women allocated to receive aprepitant treatment and 131 allocated to receive placebo treatment (Table 1). The number of women who were excluded during screening and the number who declined consent to participate were not recorded. Six women allocated to aprepitant and 9 women allocated to placebo were excluded during surgery. The primary outcome measure was recorded for 35 women in the Aprepitant group and 59 women in the Placebo group. Adverse events within 6 weeks after surgery were recorded for 34 women in the Aprepitant group and 37 women in the Placebo group" Judgement comment: large dropout rate. Reasons for missing outcome data unclear
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "baseline characteristics are summarized in Table 2. Mean age was 56 years, and the mean duration of surgery was 160 minutes" Judgement comment: baseline characteristics (age not for all participants, weight, ASA): unclear. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "immediately before the induction of anaesthesia, each patient received one of the study drugs, chosen in a double-blind, randomized fashion, i.v." Judgement comment: no further information on randomization method provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the drugs were presented in numbered, identical 4-ml ampoules containing one of the following: domperidone 20 mg, droperidol 2.5 mg, metoclopramide 10 mg or placebo (saline)" Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "...of etomidate i.v., as necessary. After operation the patients were assessed by trained members of the nursing staff. They were observed..." Judgement comment: insufficient information on blinding ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "two hundred and one patients were involved in the study initially; two were excluded from the droperidol group because ergometrine was given"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, ASA, weight): no. Potential effect modifiers (gender, perioperative opioids): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "clinical, double-blind, placebo controlled trial. Patients between the ages of 20 and 52 years were randomly assigned to one of four treatment groups using a table of computer-generated random numbers: (A) dexamethasone–metoclopramide group who received..."
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the medications were prepared to the study by the head nurse of operating room in two numbered 5 ml syringes, which were identical in appearance" Judgement comment: no statement on blinding of anaesthesiologists and participants. No statement on further involvement in the study of the head nurse who prepared the medication
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "one of the investigators blinded to the antiemetic treatment group recorded all intraoperative and recovery variables, including the incidence of PONV and the need for rescue antiemetic medication"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data (outcome of interest: vomiting in PACU)
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the four treatment groups were comparable with respect to sex, age, BMI, menstrual cycle period, prior use of cigarettes" Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV): no; (history of motion sickness, perioperative opioids): unclear

- *Age (mean ± SD, median (IQR), median (range))*: 34.9 ± 9.5
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 27.1 ± 6.2
- *ASA I/II/III/IV (n)*: 26/24/0/0
- *Gender (female in %)*: 56
- *Non-smoker (%)*: 76
- *History of PONV/motion sickness (%)*: 30
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 98.7
- *Use of perioperative opioids (if yes, which?)*: 0.49 mg fentanyl PCA
- *Type of surgery*: laparoscopic surgical procedure (cholecystectomy, herniorrhaphy, gynaecological procedure)

Included criteria: 20 to 55 years of age, ASA I or II, scheduled for elective laparoscopic surgical procedure with known high risk of PONV. Risk factors were female gender, non-smoking status, history of PONV or motion sickness, and postoperative opioids. Each risk factor was given a score of 1. Only patients who had at least 2 risk factors (risk score 2 to 4) were enrolled

Excluded criteria: over 60 years of age, ASA > III, body mass index (BMI) > 35 kg/m^2, received a prophylactic antiemetic within 24 hours of surgery, concomitant administration of steroids or psychotropic drugs, contraindication to the use of corticosteroids (glaucoma, severe hypertension, heart disease, renal failure, peptic ulcer disease, diabetes mellitus, adrenal insufficiency, immunosuppression, recent tuberculosis), pregnant or lactating women, a condition requiring long-term opioid use, allergic to any of the study drugs (excluded and replaced by other patients)

Pretreatment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions	**Intervention characteristics** Dexamethasone • *Dose*: 8mg • *Time point of administration*: dexamethasone before anaesthesia induction, saline 30 minutes before end of surgery • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 30% (4 mg ondansetron) Dexamethasone + metoclopramide • *Dose*: dexamethasone 8 mg, metoclopramide 25 mg • *Time point of administration*: dexamethasone before anaesthesia induction, metoclopramide 30 minutes before end of surgery • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 24% (4 mg ondansetron) Dexamethasone + palonosetron • *Dose*: dexamethasone 8 mg, palonosetron 0.075 mg • *Time point of administration*: dexamethasone + palonosetron before anaesthesia induction, saline 30 minutes before end of surgery • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 4% (4 mg ondansetron)
Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Mansour 2013 *(Continued)*

Vomiting (0 to 6 hours)

- Outcome type: dichotomous outcome

Vomiting (12 to 24 hours)

- Outcome type: dichotomous outcome

Nausea (0 to 24 hours)

- Outcome type: dichotomous outcome

Complete response (no PONV) in 24 hours

- Outcome type: dichotomous outcome

Extrapyramidal symptoms (0 to 24 hours)

- Outcome type: dichotomous outcome

Headache (0 to 24 hours)

- Outcome type: dichotomous outcome

Constipation (0 to 24 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Identification	**Sponsorship source:** NA **Country:** Saudi Arabia **Setting:** inpatient, single-centre **Author's name:** Emad E. Mansour **Institution:** Department of Anesthesia, Ain Shams University, Egypt **Email:** emad.mansour@gmail.com **Address:** King Fahd Military Medical Complex, PO Box 946, Dhahran 31932, Saudi Arabia **Language:** English **Duration of study:** April 2012 to August 2012 **Trial registry number:** NA **Study's primary outcome:** incidence of PONV 24 hours after surgery
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were randomly allocated into three equal groups (randomization was performed with the use of sealed envelopes) to receive one of three prophylactic regimens"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Mansour 2013 *(Continued)*

Allocation concealment (selection bias)	Unclear risk	Quote: "patients were randomly allocated into three equal groups (randomization was performed with the use of sealed envelopes) to receive one of three prophylactic regimens" Judgement comment: SNOSE not explicitly stated (sequentially numbered and opaque?)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "for proper blinding, the study drugs were prepared by the operating room (OR) pharmacy in the morning of operation. They were prepared in two identical 5 ml syringes and labeled; study drug 1 and 2. Study drug 1 was given immediately before induction of anesthesia (dexamethasone in groups D + S and D + M, and combination of dexamethasone and palonosetron in group D + P) and study drug 2 was given 30 min before the expected end of surgery (metoclopramide in group D + M, and normal saline in groups D + S and D + P) by the attending anesthesiologist who was blinded to the study"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "the total opioid analgesic consumption was recorded by the acute pain service nurse in charge who was blinded to the study" Judgement comment: no statement on blinding of personnel for assessment of other outcomes
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "all patients completed the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "groups were comparable with regard to demographic data (age, gender, BMI, ASA physical status), risk factors for PONV, and times of anesthesia; recovery; and PACU stay (Table 1)" Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Study's primary outcome: patient-controlled morphine consumption from 0 to 4 to 0 to 24 hours after operation

Trial registry number: NCT00209495

Notes	Two out of 3 groups relevant

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "according to a computer-generated block randomization schedule prepared by the hospital pharmacy"
Allocation concealment (selection bias)	Low risk	Quote: "study medication was prepared by the hospital pharmacy into identical capsules of either 300 mg pregabalin or placebo. A separate package containing either dexamethasone or isotonic sodium chloride was opened and prepared into a neutral syringe by a nurse, who was not part..." Quote: "...of the study or any handling of the patient. All medications were given to the patient by one of the investigators. Study medication was marked with the name of the project, the investigator's name and consecutive numbers according to a computer-generated block randomization schedule prepared by the hospital pharmacy..."
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "no person was aware of group assignment until all patients had been included and assessments were completed"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "no person was aware of group assignment until all patients had been included and assessments were completed"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...for inclusion in the study. One hundred and twenty-eight patients, aged 30 to 70 years, were included (Regional Hospital Herning: n 5 80, and Glostrup Hospital: n 5 48) and randomly assigned to their treatment group. However, 12 of these patients were subsequently excluded, resulting in data from 116 patients in the final analyses (Fig. 1). For seven of these patients, we only have data for the first 4 h postoperatively: four patients were re-operated and were excluded from further analyses, two patients wanted to drop out and have different analgesic medication (NSAID) and one patient's 24-h data were not obtained because of logistic problems. There were no significant differences..."
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT00209495 (retrospective registration)
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, ASA, weight): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Allocation concealment (selection bias)	Low risk	Quote: "a separate package containing either dexamethasone or isotonic sodium chloride was opened and prepared in a neutral syringe by a nurse, who was not a part of the study or involved in any handling of the patient. Two project nurses involved in research at the Department of Day Case Surgery were in charge of all medications given to the patient. Study medication was marked with the name of the project, the investigator's name and consecutive numbers according to a computer-generated block randomization schedule prepared by the hospital pharmacy. Each block contained nine numbers and the patients were assigned consecutively to their group according to their number"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "no person was aware of group assignment until all patients had been included and assessments were completed"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the project nurses conducted all assessments. No person was aware of group assignment until all patients had been included and assessments were completed"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "one hundred and forty-seven patients were included and randomly assigned to their treatment group. Sixteen patients were later excluded and consequently 131 patients were included in the final analyses..." Judgement comment: reasons for missing outcome data described and unrelated to outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT00378547 (retrospective registration)
Other bias	Unclear risk	Quote: "there were no significant differences between groups for patient characteristics and perioperative data" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Matsota 2015

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 3 groups, monoprophylaxis and combination prophylaxis
Participants	**Baseline characteristics** Droperidol (group D) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: NA • *Received treatment (n)*: NA • *Analysed (n)*: 40 • *Age (mean ± SD, median (IQR), median (range))*: 50.73 ± 14.02 • *Weight (mean ± SD, median (IQR), median (range))*: 75.63 ± 11.58 • *BMI (mean ± SD, median (IQR), median (range))*: NA

Institution: 2nd Department of Anesthesiology, University Hospital "Attikon", Athens, Greece

Email: matsota@yahoo.gr

Address: University Hospital, 1 Rimini St, Chaidari 12462, Greece

Duration of study: August 2007 to August 2010

Language: English

Study's primary outcome: number of patients experiencing PONV, percentage of patients with a complete response (no nausea and no vomiting) during the 24-hour postoperative period, number of patients who required rescue antiemetic medication

Trial registry number: NA

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "participants were randomized with the closed envelope method to one of the following three study groups" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "closed envelope method" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: no statement
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "patients at the PACU and ward were attended and interviewed by a different team of investigators unaware of the study protocol"
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "patients, with an ASA physical status I or II, aged over 18 years, weighing less than 95 kg, were initially enrolled in the study. In 10 cases a protocol deviation was recorded during their stay in the PACU (in 6 patients morphine was administered instead of meperidine and in 4 patients clonidine for the treatment of hypertension), in 8 individuals the operation was cancelled, and in 5 the procedure was converted to open cholecystectomy, and therefore all were excluded from the study; thus, 127 patients completed the protocol and were finally included: 40 in group D..." Judgement comment: rate of missing outcome data > 15%. However, reasons described and unrelated to outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "groups were similar and no statistically significant differences were detected regarding age, gender, weight, smoking status, duration of operation, intraoperative fluid administration and intraoperative meperidine dose (Table I)"

- *Gender (female in %)*: 91
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (N_2O, isoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: NA
- *Use of perioperative opioids (if yes, which?)*: morphine, hydrocodone
- *Type of surgery*: tonsillectomy

Included criteria: scheduled to undergo elective tonsillectomy, 16 to 70 years of age, ASA I, weight 50 to 100 kg

Excluded criteria: suspected diagnosis of malignancy, unilateral tonsillectomy, contraindications to the use of non-steroidal anti-inflammatory drugs

Pretreatment: baseline characteristics (age, ASA): no; (weight): unclear. Potential effect modifiers (gender): no; (duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): unclear

Interventions

Intervention characteristics

Ondansetron

- *Dose*: 4 mg
- *Time point of administration*: placebo at induction of anaesthesia, ondansetron during anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: cyclizine 50 mg IM

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "randomly generated number sequence" Judgement comment: no information on how this number sequence was generated
Allocation concealment (selection bias)	Unclear risk	Quote: "use of non-steroidal anti-inflammatory drugs. Randomization Patients were allocated according to a randomly generated number sequence to the control group who received 2 mL of normal saline intravenously at induction of anaesthesia and the trial group who received 10 mg (2 mL) of dexamethasone intravenously at induction of anaesthesia. The instructions regarding each patient..." Quote: "...at induction of anaesthesia. The instructions regarding each patient were placed in a sealed opaque envelope, which was opened by the anaesthetist once the patient was in the anaesthetic room. Neither patient, nor surgeon, nor..." Judgement comment: it is unclear which person placed the instructions in the envelopes. It is unclear whether the person who decided on enrolment of patients was aware of the allocation

McKean 2006 *(Continued)*

Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "...at induction of anaesthesia. The instructions regarding each patient were placed in a sealed opaque envelope, which was opened by the anaesthetist once the patient was in the anaesthetic room. Neither patient, nor surgeon, nor researcher knew whether the patient had received dexamethasone. Anaesthetic and operative technique..." Judgement comment: anaesthetists were aware of group assignment
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...was in the anaesthetic room. Neither patient, nor surgeon, nor researcher knew whether the patient had received dexamethasone. Anaesthetic and operative technique..."
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "seventy-two patients were enrolled in the study. Two patients were excluded because the anaesthetist was compelled to deviate from the anaesthetic protocol in the interest of patient care. A further 24 patients dropped out of the study. Of these 16 were not contactable, six had forgotten to fill in the form and two had lost their form. The non-responders were equally divided between the two groups. Therefore, from a possible 72 patients, 46 (64%) returned their symptom sheets" Judgement comment: large dropout rate (> 15%)
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, ASA): no; (weight): unclear. Potential effect modifiers (gender): no; (duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): unclear

McKenzie 1993

- *Type of surgery*: partial or total thyroidectomy

Included criteria: female, euthyroid, ASA I or II, 20 to 65 years of age, scheduled to undergo elective partial or total thyroidectomy

Excluded criteria: administration of antiemetic medication within 24 hours before surgery; gastrointestinal disorder; significant cardiovascular, respiratory, renal, hepatic, or endocrine disease; pregnant; menstruating at the time of surgery

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (perioperative opioids, non-smoker): yes

Interventions	**Intervention characteristics** Placebo • *Dose*: 0.9% saline • *Time point of administration*: immediately after induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg Granisetron • *Dose*: 3 mg • *Time point of administration*: immediately after induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg Ondansetron • *Dose*: 4 mg • *Time point of administration*: immediately after induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg Tropisetron • *Dose*: 5 mg • *Time point of administration*: immediately after induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg
Outcomes	*Vomiting (PACU)* • Outcome type: dichotomous outcome *Vomiting (6 to 12 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** NA **Country:** Greece **Setting:** inpatient, single-centre **Author's name:** A. Papaioannou

Study's primary outcome: incidence of PONV

Trial registry number: NA

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "...and surgeons. Patients were randomly assigned by an electronic randomization table to one of four groups to receive, in a blind..."
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("in a blind manner")
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "postoperative nausea was assessed subjectively using a visual analogue scale (VAS) ruler by a doctor blind to the antiemetic/placebo administered to the patient"
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	Quote: "a total of 245 female patients were initially randomized into the four groups, namely, the placebo group (n = 62 patients, ondansetron group (n = 61), granisetron group (n = 61), and tropisetron group (n = 61). Data were lost for four, three and one patient in the placebo, ondansetron, and granisetron group, respectively. Four patients refused to continue with the study after randomization, and four patients were excluded because of inadvertent propofol administration. Twenty-five patients (Fig. 1) were not included in the final analysis due to the administration of a serotonin antagonist as rescue medication for PONV during the study period" Judgement comment: rate of missing outcome data over 15%; reasons for missing outcome data were reported and were unrelated to the outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "there were no differences among groups in terms of age, weight, height, ASA physical status, duration of anesthesia, total dose of fentanyl and volume of Ringer's lactate solution infused, days from last menstruation, and history of PONV or motion sickness" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (perioperative opioids, non-smoker): yes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "the patients were randomly assigned to one of five groups (n = 40 for each group) to receive saline (control) or granisetron (Kytril"; SmithKline Beecham Seiyaku, Tokyo, Japan) at four different doses (2 pg/kg, 5 pg/kg, 10 pg/kg, or 20 pg/kg)" Judgement comment: no details on randomization method provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "...10 pg/kg, or 20 pg/kg). Saline or granisetron was administered intravenously over 5 min immediately after the induction of anesthesia (immediately before surgery) by anesthetists who were blinded to the nature of treatment. These medications had been prepared beforehand in equivalent volume by an assistant. Vital signs (arterial blood pressure..." Judgement Comment: anaesthetists were blinded, but no indication is given on whether other personnel and participants were blinded to the intervention.
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...received a diclofenac suppository. Blind observers monitored patients for emetic episodes, severity of nausea, and vital signs for a 24 hour period that began when patients responded to a vocal command after surgery. Adverse events (rash, headache, and diarrhea) within 24 hours after surgery were assessed by questionnaire. At the completion..."
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV): no; (history of motion sickness, non-smoker, perioperative opioids): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "the patients were assigned randomly to one of three groups to receive intravenously either sterile water, droperidol 0.25 mg or droperidol 0.5 mg" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "pharmacy prepared identical, randomly numbered ampoules that contained the test dose in 0.5 ml"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "a direct enquiry about postoperative nausea and vomiting was made al this time, and questionnaires and prepaid envelopes were given to the patients with instructions that these should be completed 24 hours after discharge" Quote: "the patients were assessed by an experienced anaesthetist and deemed fit for discharge if they were free from significant pain, sedation and nausea, had no surgical complications such as continued blood loss. and could dress themselves and walk steadily" Judgement comment: insufficient information on blinding of recovery staff and anaesthetist who assessed the outcomes. For the 24 hour time point questionnaires were used
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	Quote: "there was a 76% response to the questionnaire (Table 4)..." Quote: "test for nonparametric data. The results of six patients were excluded from the trial due to noncompliance with the protocol. Thc characteristics..."

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Millar 1987 *(Continued)*

		Judgement comment: all missing data before discharge with reasons explained. High rate of loss of response to the questionnaire at 24 hours (24%)
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "the characteristics of the three groups were similar. There were no significant differences in age, weight or gestation. Significantly fewer patients in the group that received droperidol 0.5 mg had had a previous anaesthetic, and a significantly greater proportion of patients in both droperidol groups gave a history of nausea and vomiting after general anaesthesia" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of motion sickness, non-smoker): unclear; (history of PONV): yes

- *Duration of anaesthesia or surgery (in min; as mean or median)*: 178.52
- *Use of perioperative opioids (if yes, which?)*: "a willful effort was made to avoid opioids"
- *Type of surgery*: mastoidectomy, tympanoplasty

Included criteria: either sex, 18 to 52 years of age, ASA I or II, undergoing middle ear surgery

Excluded criteria: pregnant; obesity; diabetes mellitus; impaired renal or liver function; had taken H2 antagonist, antiemetic, or psychoactive medication; nausea, retching, or vomiting within 48 hours before surgery

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Interventions	**Intervention characteristics** Control (group I) • *Dose*: saline, placebo plaster • *Time point of administration*: at end of surgical procedure • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV Ondansetron (group III) • *Dose*: ondansetron 4 mg, placebo plaster • *Time point of administration*: at end of surgical procedure • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV
Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Vomiting (0 to 6 hours)* • Outcome type: dichotomous outcome *Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** the study was supported financially by the study authors **Country:** India **Setting:** inpatient, single-centre **Author's name:** Asok Jayaraj Pullani **Institution:** Department of Anesthesioogy, M.L.N. Medical College and Associated Hospitals, Allahabad, India **Email:** ashokjayaraj@yahoo.com

Notes	Two out of 3 groups relevant (acustimulation)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using a computer-generated random number table"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "anesthesia was standardized and given by an anesthesiologist blinded to group assignment" Judgement comment: study design ensures blinding of participants (placebo treatment)
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the incidence of PONV was evaluated within six hours and 24 hours after transfer to the postoperative unit by a blinded observer"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 120 patients enrolled, three were subsequently excluded because they required administration of dexamethasone in the postoperative period for bronchospasm in two cases and facial nerve injury in one case"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the demographic characteristics of the three groups were similar, as were history of previous PONV and motion sickness. None of the women included in the study were in their menstrual phase. There were no significant differences between the three groups with respect to duration of surgery or anesthesia, or the amount of iv fluids administered (Table I)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomized to one of two groups: group 1 patients (n = 23) received 2.5 mg droperidol intravenously when the surgery was started, while group 2 patients (n = 29) did not receive any droperidol" Judgement comment: no further information on randomization method provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "patients were randomized to one of two groups: group 1 patients (n = 23) received 2.5 mg droperidol intravenously when the surgery was started, while group 2 patients (n = 29) did not receive any droperidol..." Judgement comment: no placebo intervention in the control arm. No blinding
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "any episodes of nausea and vomiting, rescue medications, and adverse effects were recorded until the next morning after the surgery by nurses who had not been informed of this study" Quote: "both patients and nurses were unaware of the anaesthetic technique"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "...but the total fentanyl dose in group 1 was higher than that in group 2" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (non-smoker, history of PONV/motion sickness): unclear; (perioperative opioids): yes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using simple randomization by a computer-generated random number chart"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the test drug, prepared by personnel blinded to the study, was administered 10 min before the induction of anesthesia"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blinded")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "deviation and number (%). The two groups were comparable with respect to their demographic profile as shown in Table 1. The incidence of nausea, vomiting" Quote: "there was no statistical difference between the two groups, palonosetron and granisetron, with respect to their demographic profiles such as age, weight, height, sex, duration of anesthesia and surgery, presence of comorbidities, and ASA status" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Placebo (group B)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 36
- *Received treatment (n)*: NA
- *Analysed (n)*: 36
- *Age (mean ± SD, median (IQR), median (range))*: 38.9 ± 12.7
- *Weight (mean ± SD, median (IQR), median (range))*: 61.5 ± 11.4
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: balanced anaesthesia (thiopental or pethidine), N_2O
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 79.2
- *Use of perioperative opioids (if yes, which?)*: intraoperative pethidine
- *Type of surgery*: laparotomy, other

Included criteria: gynaecological patients subjected to elective operation under general anaesthesia

Excluded criteria: over 70 years of age, bronchial asthma or severe chronic bronchitis, patient who was to undergo caesarean section

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

---

Interventions

Intervention characteristics

Droperidol (group A 5 mg)

- *Dose*: 5 mg
- *Time point of administration*: before anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Droperidol (group A 2.5 mg)

- *Dose*: 2.5 mg
- *Time point of administration*: before anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Placebo (group A)

- *Dose*: saline
- *Time point of administration*: before anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Droperidol (group B 5 mg)

- *Dose*: 5 mg
- *Time point of administration*: before anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Mortensen 1982 *(Continued)*

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "randomized" No further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind", "unmarked ampoules")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "patients were kept under observation in the recovery room and in the ward by the nursing stall 'for the first 24 hour postoperatively" Judgement comment: insufficient information on blinding ("double-blind", "unmarked ampoules")
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	Quote: "...or placebo, shortly prior to anaesthesia. Eight patients were excluded from the investigation, four of them from the placebo group, due to the fact that compounds other than those mentioned below were required during the anaesthesia. The material included all gynaecological..." Judgement comment: per-protocol analysis. Reasons for missing data not reported for 4 participants
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: quote: "Table 1 shows that the patient groups were comparable with regard to age, weight and type of anaesthesia" Baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

- *Use of perioperative opioids (if yes, which?)*: 6 patients received buprenorphine as rescue analgesic
- *Type of surgery*: laparoscopic bariatric surgery

Included criteria: ASA II or III, between 18 and 44 years of age, both sexes, general anaesthesia for laparoscopic bariatric surgery

Excluded criteria: known hypersensitivity or contraindication to study medications, chronic nausea, vomiting, motion sickness or retching experience in the 24 hours before anaesthesia, received an antiemetic drug or drug with antiemetic properties during the 24 hours before anaesthesia, breastfeeding, menstruating, conditions that required long-term opioid administration, gastrointestinal disease, diabetes mellitus, neuromuscular disease, smoker

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions

Intervention characteristics

Granisetron (group I)

- *Dose*: 1 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 0.2 mg/kg IV

Granisetron + droperidol (group II)

- *Dose*: granisetron 1 mg, droperidol 1.25 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 0.2 mg/kg IV

Granisetron + dexamethasone (group III)

- *Dose*: granisetron 1 mg, dexamethasone 8 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 0.2 mg/kg IV

Placebo (group IV)

- *Dose*: saline
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 0.2 mg/kg IV

Outcomes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomly allocated to one of the following two groups to receive either injection ramosetron 0.3 mg IV or injection ondansetron 6 mg IV just before extubation" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...received injection ondansetron (6 mg). To ensure blindness, either of the study drugs was diluted in 0.9% normal saline to a volume of 4 ml and coded by the technologist in charge of operation theater who did not reveal the nature of drug to anyone till the completion of the study. He also maintained a register..."
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "after surgery, all the patients were observed for 24 hours. Throughout the study period, vital signs such as pulse rate, blood pressure, and respiratory rate were monitored and recorded every 6 hours, except during sleep" Judgement comment: no information on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV): no; (history of motion sickness, non-smoker, perioperative opioids): unclear

Dolasetron (12.5 mg group)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 18
- *Received treatment (n)*: NA
- *Analysed (n)*: 18
- *Age (mean ± SD, median (IQR), median (range))*: 59 (54 to 70)
- *Weight (mean ± SD, median (IQR), median (range))*: 75 (65 to 84)
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 56
- *Non-smoker (%)*: 78
- *History of PONV/motion sickness (%)*: 33
- *Type of general anaesthesia*: TIVA (propofol, remifentanil)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 76.2
- *Use of perioperative opioids (if yes, which?)*: remifentanil intraoperative, piritramide intraoperative
- *Type of surgery*: ocular surgery

Dolasetron (50 mg group)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 20
- *Received treatment (n)*: NA
- *Analysed (n)*: 20
- *Age (mean ± SD, median (IQR), median (range))*: 61 (48 to 69)
- *Weight (mean ± SD, median (IQR), median (range))*: 73 (66 to 85)
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 40
- *Non-smoker (%)*: 80
- *History of PONV/motion sickness (%)*: 50
- *Type of general anaesthesia*: TIVA (propofol, remifentanil)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 77.4
- *Use of perioperative opioids (if yes, which?)*: remifentanil intraoperative, piritramide intraoperative
- *Type of surgery*: ocular surgery

Ondansetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 18
- *Received treatment (n)*: NA
- *Analysed (n)*: 18
- *Age (mean ± SD, median (IQR), median (range))*: 61 (48 to 70)
- *Weight (mean ± SD, median (IQR), median (range))*: 78 (68 to 85)

- *Non-smoker (%)*: 74
- *History of PONV/motion sickness (%)*: 26
- *Type of general anaesthesia*: TIVA (propofol, remifentanil)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 79.8
- *Use of perioperative opioids (if yes, which?)*: remifentanil intraoperative, piritramide intraoperative
- *Type of surgery*: ocular surgery

Placebo

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 23
- *Received treatment (n)*: NA
- *Analysed (n)*: 23
- *Age (mean ± SD, median (IQR), median (range))*: 62 (49 to 68)
- *Weight (mean ± SD, median (IQR), median (range))*: 74 (70 to 84)
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 48
- *Non-smoker (%)*: 87
- *History of PONV/motion sickness (%)*: 35
- *Type of general anaesthesia*: TIVA (propofol, remifentanil)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 75
- *Use of perioperative opioids (if yes, which?)*: remifentanil intraoperative, piritramide intraoperative
- *Type of surgery*: ocular surgery

Included criteria: ASA I or III, receiving implantation of an episcleral radioactive applicator for treatment of ocular malignant melanoma

Excluded criteria: NA

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions	**Intervention characteristics** Dolasetron (12.5 mg group) • *Dose*: 12.5 mg • *Time point of administration*: 15 minutes before induction

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Muller 2003 *(Continued)*

- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: dolasetron 12.5 mg (4)

Dolasetron (50 mg group)

- *Dose*: 50 mg
- *Time point of administration*: 15 minutes before induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: dolasetron 12.5 mg (2)

Ondansetron

- *Dose*: 8 mg
- *Time point of administration*: 15 minutes before induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: dolasetron 12.5 mg (2)

Droperidol

- *Dose*: 20 µg/kg
- *Time point of administration*: 15 minutes before induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: dolasetron 12.5 mg (2)

Placebo

- *Dose*: NaCl 0,9%
- *Time point of administration*: 15 minutes before induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: dolasetron 12.5 mg (7)

Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** NA **Country:** Germany **Setting:** inpatient, single-centre **Author's name:** Jürgen Peters **Institution:** Klinik für Anästhesiologie und Intensivmedizin, Universitätsklinikum Essen **Email:** juergen.peters@uni-essen.de **Address:** Klinik für Anästhesiologie und Intensivmedizin, Universitätsklinikum Essen, Hufelandstraße 55, 45122 Essen **Duration of study:** NA **Language:** German (2 German reviewers) **Study's primary outcome:** NA **Trial registry number:** NA

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were randomized to receive either dexamethasone (dexamethasone group) or saline placebo (control group) using a computer-generated randomization code"
Allocation concealment (selection bias)	Low risk	Quote: "the randomization code for the 117 subjects was provided to the operating room pharmacy before the start of the study. Study medications were prepared by the operating room pharmacy in a 3-mL syringes labeled with the patient's name. Either dexamethasone (8-mg to 2 mL total volume) or saline placebo (2-mL total volume) was drawn into each syringe"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all clinicians and researchers were blinded to group assignment"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all clinicians and researchers were blinded to group assignment"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 117 subjects were enrolled in this investigation. The operating room pharmacy was unable to prepare the study drug at the time of anesthetic induction in 8 patients (7 in the dexamethasone group and 1 in the control group); these subjects were excluded from the study. Data analysis was performed on the 109 patients who received the study drug (60 in the dexamethasone group and 49 in the control group)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "1. There were no differences between groups in sex, age, weight, height, pre-existing medical conditions, preoperative medications, baseline ejection fraction, or type of surgical procedure" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, perioperative opioids): no; (history of PONV/motion sickness): unclear

	Trial registry number: NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using a computer-generated randomization code"
Allocation concealment (selection bias)	Low risk	Quote: "study medications were prepared by the operating room pharmacy in 3-ml syringes labeled with the patient's name" Quote: "the randomization code for the 120 subjects was provided to the operating room pharmacy before the start of the study"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all care providers, researchers, and patients were blinded to group assignments"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "study; all care providers, researchers, and patients were blinded to group assignments"
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "surveys were completed on POD1 by 91 of the 115 study subjects (79.1%)" Judgement comment: rate of missing outcome data > 15%. Reasons described and appeared to be unrelated to the outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no significant differences between groups in age, weight, height, sex, preexisting medical conditions (with the exception of a higher incidence of hypertension in the dexamethasone group), or American Society of Anesthesiologists physical status (table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, perioperative opioids): no; (history of PONV/motion sickness): unclear

Outcomes	*Vomiting (PACU)* • Outcome type: dichotomous outcome *Postoperative wound infection (until time of discharge)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** support was provided solely from institutional and/or departmental sources **Country:** USA **Setting:** inpatient, single-centre **Author's name:** Glenn S. Murphy **Institution:** Department of Anesthesiology, NorthShore University HealthSystem, Evanston and Department of Anesthesiology, Northwestern University Feinberg School of Medicine, Chicago, Illinois, USA **Email:** dgmurphy2@yahoo.com **Address:** Department of Anesthesia, NorthShore University HealthSystem, 2650 Ridge Ave., Evanston, IL 60201, USA **Duration of study:** NA **Language:** English **Study's primary outcome:** perioperative glucose concentrations **Trial registry number:** NCT01545700
Notes	Six groups (3 for early outcome assessment, 3 for late outcome assessment) pooled into 3 groups for analysis

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "two hundred patients were allocated randomly (block randomization computer-generated randomization code) to 1 of 6 groups (3 early groups, 3 late groups) to determine the effect of dexamethasone on the incidence of early and late hyperglycemic events"
Allocation concealment (selection bias)	Low risk	Quote: "the randomization code for the 200 subjects was provided to the operating room pharmacy before the start of the study; all care providers, patients, and researchers were blinded to group assignment. Study medications were prepared by the operating room pharmacy in 3-mL syringes labeled with the patient's name. Either dexamethasone (4 mg with 1 mL saline or 8 mg-2 mL total volume) or saline (control-2 mL total volume) was drawn into each syringe..."

Murphy 2014 *(Continued)*

Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all care providers, patients, and researchers were blinded to group assignment"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all care providers, patients, and researchers were blinded to group assignment"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "two hundred patients were enrolled in this clinical trial. One patient was excluded for a protocol violation, and 4 patients refused postoperative blood sampling. Therefore, complete data were collected on 96 patients in the early groups and 99 patients in the late groups. Patient characteristics are presented"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT01545700 (retrospective registration)
Other bias	Unclear risk	Quote: "patients in the late groups. Patient characteristics are presented in Tables 3 and 4. There were no significant differences between the control, 4 mg, or 8 mg groups in baseline demographic characteristics (including preexisting medical conditions or use of preoperative medications, data not presented). The number of patients undergoing either a transabdominal or laparoscopic transvaginal surgical approach did not differ between groups. Intraoperative management data and postoperative" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

- *Weight (mean ± SD, median (IQR), median (range))*: 69.9 ± 13.5
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 86.21
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (N_2O, isoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 129.5
- *Use of perioperative opioids (if yes, which?)*: 195.7 µg fentanyl intraoperative, postoperative meperidine
- *Type of surgery*: laparoscopic cholecystectomy

Included criteria: ASA I or II, both sexes, 21 to 68 years of age, weighing 40 to 101 kg, undergoing elective laparoscopic cholecystectomy

Excluded criteria: receiving drugs known to have antiemetic effects (such as tricyclic antidepressants, scopolamine, phenothiazines, lorazepam, corticosteroids, and trimethobenzamide), had experienced nausea and vomiting or had taken antiemetic treatment in the 48 hours before surgery

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker): unclear; (perioperative opioids): yes

Interventions

Intervention characteristics

Ondansetron

- *Dose*: 4 mg
- *Time point of administration*: before induction and after establishment of venous access
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV

Tropisetron

- *Dose*: 5 mg
- *Time point of administration*: before induction and after establishment of venous access
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV

Granisetron

- *Dose*: 3 mg
- *Time point of administration*: before induction and after establishment of venous access
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV

Metoclopramide

- *Dose*: 10 mg
- *Time point of administration*: before induction and after establishment of venous access
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV

Placebo

- *Dose*: NaCl 0.9%
- *Time point of administration*: before induction and after establishment of venous access
- *Route of administration*: IV

- *Type of surgery*: hysterectomy

Included criteria: scheduled for elective hysterectomy at Mayo Clinic in Arizona; ASA I, II, or III

Excluded criteria: pregnancy; concomitant bowel surgery other than appendectomy; hypersensitivity to study drug or rescue medication; preoperative score for nausea > 4 out of 10 points; severe hepatic insufficiency (Child-Pugh score > 9); any condition that impairs the patient's ability to complete study assessments; intraoperative haemodynamic instability; ICU admission; prolonged postoperative intubation; rifampin, carbamazepine, phenytoin, or other drugs that strongly induce CYP3A4 activity; other antiemetic within 12 hours before surgery; participation in a clinical trial using an investigational product

Pretreatment: baseline characteristics (age): no; (weight, ASA): unclear. Potential effect modifiers (gender): no; (history of PONV/motion sickness, non-smoker, perioperative opioids, duration of surgery): unclear

Interventions	**Intervention characteristics** Aprepitant • *Dose*: 40 mg • *Time point of administration*: before anaesthesia induction • *Route of administration*: PO • *Rescue antiemetics (if yes, which?)*: NA

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients enrolled in the study. Randomisation was carried out at the end of the operation at the time of gallbladder retrieval by computer generated random number inside a numbered, sealed, opaque envelope. Patients were randomly allocated..."
Allocation concealment (selection bias)	Low risk	Quote: "patients enrolled in the study. Randomisation was carried out at the end of the operation at the time of gallbladder retrieval by computer generated random number inside a numbered, sealed, opaque envelope. Patients were randomly allocated..."
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "...a numbered, sealed, opaque envelope. Patients were randomly allocated to receive either a single dose of ondansetron 8mg given intravenously or nothing immediately after randomisation. All patients received a standardised..." Judgement comment: no sham treatment. The anaesthesiologists knew the assignment. Randomization, however, was done at the end of the operation. Therefore, patients were blinded. It remains unclear whether unblinded anaesthesiologists could influence postoperative outcomes after randomization
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...conclusion of surgery. Post-operatively, a team of surgeon and nursing staff who were blinded to the study was responsible for managing these patients in the day surgery centres. Oral dologesic, ibuprofen or intramuscular..."
Incomplete outcome data (attrition bias)	Low risk	Judgement comment: no missing outcome data

Nielsen 2015 *(Continued)*

Duration of study: 7 December 2012 to 7 December 2014

Language: English

Study's primary outcome: primary outcome was pain during mobilization (visual analogue scale) 2 to 24 hours postoperatively

Trial registry number: NCT01953978

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "randomization was performed by the pharmacy according to a computer-generated block randomization list (each block containing 10 numbers), in a 1:1 ratio"
Allocation concealment (selection bias)	Low risk	Quote: "study medication was prepacked by the pharmacy in consecutively numbered boxes according to the computer-generated randomization list, containing identical 1 mL ampoules of either dexamethasone 4 mg/mL (Dexamethasone; GALEN-Pharma GmbH, Kiel, Germany) or isotonic sodium chloride 9 mg/ mL. After inclusion, patients were given the treatment corresponding to their randomization number and the corresponding box. Information about treatment was concealed in consecutively numbered, sealed, opaque envelopes to enable unblinding in case of acute complications"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the intervention was blinded to patients, investigators, surgeons, and clinical personnel"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: the intervention was blinded to patients, investigators, surgeons, and clinical personnel
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "three hundred ninety-nine consecutive patients were considered for inclusion and eventually, 160 patients were included and randomly assigned to the treatment or the placebo group. Seven patients were excluded, and consequently, 153 patients were included in the final analysis, 77 and 76 patients in the dexamethasone and placebo groups, respectively (Fig. 1)" Judgement comment: reasons for missing outcome data unrelated to the outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT01953978 (retrospective registration)
Other bias	Unclear risk	Quote: "there were no significant differences in patient characteristics, or preoperative and perioperative characteristics between the 2 groups (Table 1)" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids, Apfel's risk score): no

- *History of PONV/motion sickness (%)*: 100
- *Type of general anaesthesia*: balanced anaesthesia
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 60 to 180 (overall)
- *Use of perioperative opioids (if yes, which?)*: NA
- *Type of surgery*: laparoscopic/laparotomy, gynaecological surgery, laparoscopic cholecystectomy

Included criteria: female, known risk factors for PONV, undergoing gynaecological or gallbladder surgery, ASA I or II

1. Female with the following 3 risk factors:
- premenopausal or perimenopausal between the ages of 18 and 55 years, not of childbearing potential (i.e. physically incapable of becoming pregnant), demonstrating a negative serum or a negative urine pregnancy test within 24 hours before the first administration of study medication and agrees to:
- abstain from sexual intercourse for 2 weeks before administration of the first dose of study medication until 30 days after the final dose of study medication, or
- use hormonal methods of birth control (e.g. oral, injectable, implantable) or other highly effective method of contraception (e.g. an intrauterine device (IUD)) in conjunction with a barrier method of contraception (condom, spermicidal foam, sponge, gel, diaphragm) if engaging in sexual intercourse for at least 7 days before the first dose of study medication and continuing until 30 days after the final dose of study medication
- have never smoked or used (e.g. chewing) tobacco (including nicotine patches) for the previous 12 months
- have a history of postoperative nausea and vomiting and/or motion sickness
2. Undergoing a laparoscopic/laparotomy gynaecological surgical procedure or laparoscopic cholecystectomy that is scheduled for no less than 1 hour and no longer than 3 hours in duration. For the purposes of this study, “scheduled” is considered the duration of time that the surgical suite is blocked for the procedure (i.e. the operating room block time) or the duration of time in which it is anticipated that the subject will be in the operative preparation/operating room
3. Scheduled to receive general anaesthesia with an anaesthetic regimen as described in the Anesthetic Regimen (see Section 4.2., “Anesthetic and Analgesic Regimens”)
4. Meeting ASA Physical Status Classification of I or II preoperatively on the day of surgery

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NKO101287 *(Continued)*

5. Having haematology and blood chemistry values within acceptable limits (i.e. within 10% outside (either above or below) normal reference values, unless otherwise specified) for surgery, including, but not limited to:
- haemoglobin, hematocrit, total white blood cell count, platelet counts
- alkaline phosphatase, blood urea nitrogen or serum urea, electrolytes (sodium, potassium, chloride, bicarbonate)
- liver function tests (alanine aminotransferase (ALT) and aspartate aminotransferase (AST) < 1.5 times the upper limit of normal), serum creatinine (< 1.5 times the upper limit of normal), total bilirubin (< 1.5 times the upper limit of normal)
6. Able and willing to complete daily components of the subject diary preoperatively on the day of surgery and until the end of the 120-hour assessment period, and available to respond to follow-up by study personnel at the 120-hour study period post emergence from anaesthesia
7. Understanding the nature and purpose of this study and the study procedures and signed an informed consent form for this study to indicate this understanding

Excluded criteria:

1. Meeting ASA Physical Status Classification of III, IV, or V preoperatively on the day of surgery
2. Pregnant or lactating
3. Post-menopausal. If the last menstrual period was within the previous 18 months, a follicle-stimulating hormone (FSH) evaluation in the postmenopausal range will satisfy that the subject is post-menopausal
4. Scheduled to undergo only a laparoscopic biopsy
5. Scheduled to receive neuraxial anaesthesia (e.g. epidural, spinal, caudal anaesthesia) or total IV anaesthesia
6. Scheduled to receive propofol for maintenance of anaesthesia
7. Scheduled to have gastric contents suctioned continuously during the surgical procedure via a nasogastric tube, or a nasogastric or oral gastric tube during the postoperative period. A single pass at the beginning or at the end of the surgical procedure and intraoperative gastric suctioning of air are permitted
8. Taking more than 10 mg to 15 mg of oxycodone, or an equivalent opioid dose, on a regular, daily basis, for more than 3 consecutive days in the week before surgery
9. Received an investigational drug in the previous 30 days or scheduled to receive any investigational drug in addition to GW597599 during the study period
10. Persistent or recurrent nausea and/or vomiting due to other aetiologies, including, but not limited to, gastric outlet obstruction, hypercalcaemia, active peptic ulcer, increased intracranial pressure, or brain metastases
11. Experienced retching or vomiting or uncontrolled nausea within 48 hours before administration of the GW597599 study medications
12. Experienced significant nausea in the 24-hour period before receiving the GW597599 study medications
13. Received radiation therapy to the abdomen or the pelvis in the seven days before receiving study medications and/or will receive radiation therapy to the abdomen or the pelvis in the evaluation period
14. History of wound dehiscence
15. History of any other illness, which, in the opinion of the Investigator, may pose an unacceptable risk when study medication is administered
16. Any current or past medical condition (e.g. vagotomy) and/or requiring medication to treat a condition that could confound evaluation of the data collected in this clinical trial
17. Known hypersensitivity or contraindication to ondansetron hydrochloride or ondansetron, another 5-HT3 receptor antagonist, any scheduled anaesthetic or analgesic agents, or any component of GW597599
18. Known hypersensitivity to fentanyl and/or ketorolac tromethamine
19. Known allergy to eggs or egg products (component of propofol)
20. Scheduled to receive antiemetics not outlined in the study dosing scheme
21. Received medication with known or potential antiemetic activity within the 24-hour period before receiving study medications. This includes, but is not limited to:
- 5-HT3 receptor antagonists (e.g. ondansetron, granisetron, dolasetron, tropisetron, ramosetron). Palonosetron is not permitted for 7 days before the study
- benzamide/benzamide derivatives (e.g. metoclopramide, alizapride)
- benzodiazepines (except if the subject is receiving such medication for sleep and has been on a stable dose for at least 7 days before the first dose of study medication; however, lorazepam is prohibited)

	Complete response (no PONV) in 24 hours • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** GlaxoSmithKline **Country:** international, 40 sites in 10 countries (United Kingdom, United States, Denmark, Slovenia, Norway, Hungary, Spain, Thailand, Hong Kong, and Phillippines) **Setting:** inpatient, multi-centre (39) **Author's name:** GSK Clinical Trials (NKT102245) **Institution:** GlaxoSmithKline **Email:** NA **Address:** NA **Duration of study:** 15 February 2005 to 23 August 2005 **Language:** English **Study's primary outcome:** complete response within 0 to 72 hours **Trial registry number:** NCT00274690, EUCTR2004-000369-37
Notes	Repeated doses of casopitant at days 2 and 3 postoperatively (only data from 0 to 24 hours are eligible); study report available on GSK study register

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Judgement comment: interactive voice response telephone-based system (RAMOS) was used for registration and randomization
Allocation concealment (selection bias)	Low risk	Judgement comment: central allocation
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Judgement comment: tablet supplies were blinded. So neither the research pharmacist, the investigator, nor the subject would know whether the dose contained active or placebo investigational product
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: tablet supplies were blinded. So neither the research pharmacist, the investigator, nor the subject would know whether the dose contained active or placebo investigational product
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: in total, 93% of participants completed the study; reasons for withdrawal described and equally distributed among groups. AE was the reason for withdrawal for 2 subjects (ondansetron) and for 1 subject each in the casopitant-ondansetron groups
Selective reporting (reporting bias)	Low risk	Judgement comment: NCT00274690 (retrospective registration), EUCTR2004-000369-37 (prospective registration). The prospectively registered primary outcome (complete response in 72 hours) was reported in the pre-specified way in the final study report

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Judgement comment: IVRS was used for randomization

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NKT102260 *(Continued)*

Allocation concealment (selection bias)	Low risk	Judgement comment: central allocation
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Judgement comment: tablet supplies were blinded. So neither the research pharmacist, the investigator, nor the subject would know whether the dose contained active or placebo investigational product
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: tablet supplies were blinded. So neither the research pharmacist, the investigator, nor the subject would know whether the dose contained active or placebo investigational product
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: in total, 90% of participants completed the study; reasons for withdrawal are described and are equally distributed among groups. AE was the reason for withdrawal for 3 subjects (1 in ondansetron-casopitant 100 mg, 2 in casopitant 150 mg)
Selective reporting (reporting bias)	Unclear risk	Judgement comment: EUCTR2004-000370-31, NCT00108095 (retrospective registration)
Other bias	Low risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of surgery, perioperative opioids, history of PONV/motion sickness, non-smoker): no

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the patients were randomly assigned into two groups for the treatment of PONV by using table of random numbers"
Allocation concealment (selection bias)	High risk	Quote: "an anaesthesia resident and a pharmacist in the hospital prepared the medications in 2 ml syringes, A containing 2 ml normal saline and B containing 2 ml of 4mg of dexamethasone while the researcher was blinded. At induction of anaesthesia the contents of the labelled syringes were administered to patients by the researcher according to the alphabets A and B assigned to the patients" Judgement comment: high possibility to foresee the assignments by using an open random allocation schedule (list of random numbers, coding A and B)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "an anaesthesia resident and a pharmacist in the hospital prepared the medications in 2 ml syringes, A containing 2 ml normal saline and B containing 2 ml of 4 mg of dexamethasone while the researcher was blinded. At induction of anaesthesia the contents of the labelled syringes were administered to patients by the researcher according to the alphabets A and B assigned to the patients"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "patients were subsequently assessed by the blinded investigator"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "one hundred patients participated in this study but four were disqualified for the following reasons: two had severe postoperative haemorrhage which required re-exploration, one had failed intubation and surgery was cancelled while the fourth had severe hypertension postoperatively necessitating the use of hydralazine intravenously in the postoperative period. Therefore only data from ninety six patients were analyzed"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (ASA): no; (age, weight): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

Risk of bias

Bias	**Authors' judgement**	**Support for judgement**

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Olatosi 2008 *(Continued)*

Random sequence generation (selection bias)	Low risk	Quote: "the patients were randomly assigned by computer-generated balloting to one of three groups (A, B, C). The study..."
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement on allocation concealment
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "...and investigator blinding was ensured. The study drugs were drawn and labelled A, B or C (A – promethazine 25 mg, B – ondansetron 8 mg, and C – placebo) in sterile 20 ml syringes and made to equal volumes of 20 ml with normal saline. All the drugs were colourless" Judgement comment: because study drugs are labelled A, B, or C, anaesthetists may be aware of group allocation
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "achieved with atropine and neostigmine. Postoperatively, the patients were evaluated for nausea and vomiting by a senior registrar blinded to the designated agent. Nausea and vomiting were assessed"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (non-smoker, history of PONV/motion sickness, perioperative opioids): unclear

- *Type of surgery*: elective gynaecological or breast surgery

Included criteria: female, at least 18 years of age, ASA I to III, undergoing elective gynaecological or breast surgery under general anaesthesia that was expected to last a minimum of 1 hour and requires hospitalization of at least 72 hours. Patients must provide written informed consent and have at least 1 of the 2 following PONV risk factors: (1) history of PONV and/or currently prone to motion sickness; (2) non-smoking status. Scheduled to receive nitrous oxide as part of the maintenance phase of the anaesthesia

Excluded criteria: any drug with potential antiemetic efficacy within 24 hours before anaesthetic procedures; any vomiting, retching, or nausea in the 24 hours preceding anaesthesia; scheduled to receive nasogastric suctioning postoperatively; body mass index (BMI) > 40; known hypersensitivity/contraindication to 5-HT3 antagonists or study drug excipients

Pretreatment: baseline characteristics (age, weight, ASA): unclear. Potential effect modifiers (gender): no, (perioperative opioids, duration of anaesthesia, non-smoker, history of PONV/motion sickness): unclear

Trial registry number: NA

Notes	Only data during PACU are relevant because patients received ondansetron routinely after discharge from PACU

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "according to a computer-generated random-number table"
Allocation concealment (selection bias)	Unclear risk	Quote: "the randomization was concealed before consent and remained double-blind and concealed until after completion of the study" Judgement comment: no statement on how randomization was concealed
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the patients, the investigators administering the medications, collecting data, or interviewing the patients, and all the health care providers involved in the direct care of the patients were blinded to the patient group assignment"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the patients, the investigators administering the medications, collecting data, or interviewing the patients, and all the health care providers involved in the direct care of the patients were blinded to the patient group assignment"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "percentages as appropriate. Sixty-four patients were enrolled in the study. However, four patients (2 in the control group and 2 in the investigation treatment group) were excluded from final data analysis for the following reasons: 1 patient had a protocol violation due to difficult intubation, one had emetic symptoms within 24 hours before surgery, and 2 had a change of surgical plan. Of the remaining 60 evaluable patients, each group had 30 patients. Data analysis was conducted and results reported were obtained from the full data set of all 60 evaluable patients without missing or excluded data. All patients in both groups..."
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "following a computer- generated random list."
Allocation concealment (selection bias)	Unclear risk	Judgement comment: insufficient information on allocation concealment provided
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "a nurse not involved in any of the subsequent evaluations, dispensed and administered the medications"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the same blinded observer (SPK) performed all the assessments in the recovery room and conducted telephone follow-up after 24 hours"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, ASA, weight): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

Study's primary outcome: NA

Trial registry number: NA

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "study patients were enrolled and randomized with Bernoulli tables (which allow “complete” or “unrestricted” randomization, minimizing both selection and accidental biases), to receive prophylactic either intravenous"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the anesthesiologist and staff nurses, as well as the operative team, were blinded to the administered agent"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the patients and investigators collecting the data were blinded to the patient’s group"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "during the study period, 127 patients were enrolled and randomized into the granisetron (G group, n=45), tropisetron (T group, n=40), or the control group (C group, n=42)..." Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "the three groups were homogenous in respect to age, gender, weight, height, and operative time as well as to all the usually recognized risk factors for PONV (female sex, history of motion sickness and/or previous PONV, nonsmoking status) [Table 1]. Anesthesia time was significantly lower in the granisetron group [Table 1]" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, history of PONV/motion sickness, non-smoker): no; (perioperative opioids): unclear; (duration of anaesthesia): yes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "were randomly divided" No further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Judgement comment: there was no placebo intervention in the control group. Blinding of anaesthesiologists not possible
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: quote: "nurses not involved in the study observed PONV..." (translated)
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (non-smoker, perioperative opioids): unclear

Participants

Baseline characteristics

Ondansetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 45
- *Received treatment (n)*: 45
- *Analysed (n)*: 45
- *Age (mean ± SD, median (IQR), median (range))*: 42.8 ± 7.3
- *Weight (mean ± SD, median (IQR), median (range))*: 55.3 ± 7.3
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: 37/8/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 95.6
- *History of PONV/motion sickness (%)*: 42.2
- *Type of general anaesthesia*: inhalational (N_2O, sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 137.1
- *Use of perioperative opioids (if yes, which?)*: PCA fentanyl 4 µg bolus with 16 µg/h background infusion for postoperative pain
- *Type of surgery*: laparoscopic ovarian cystectomy 18, laparoscopic hysterectomy 27

Palonosetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 45
- *Received treatment (n)*: 45
- *Analysed (n)*: 45
- *Age (mean ± SD, median (IQR), median (range))*: 42.4 ± 10.0
- *Weight (mean ± SD, median (IQR), median (range))*: 56.9 ± 7.8
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: 40/5/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 86.7
- *History of PONV/motion sickness (%)*: 44.4
- *Type of general anaesthesia*: inhalational (N_2O, sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 130.4
- *Use of perioperative opioids (if yes, which?)*: PCA fentanyl 4 µg bolus with 16 µg/h background infusion for postoperative pain
- *Type of surgery*: laparoscopic ovarian cystectomy 17, laparoscopic hysterectomy 28

Included criteria: at least 21 years old, ASA I or II, scheduled to undergo elective laparoscopic gynaecological surgery of at least 1 hour duration at Incheon St Mary's Hospital, Incheon, female, used opioids to control postoperative pain, had at least 2 risk factors for PONV

Excluded criteria: received antiemetics, steroids or psychoactive medications within 24 hours of study initiation, vomiting or retching in 24 hours before surgery, had received cancer chemotherapy within 4 weeks or emetogenic radiotherapy within 8 weeks before study entry, ongoing vomiting from gastrointestinal disease

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

	Study's primary outcome: incidence of PONV **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "assigned by computer- generated random numbers"
Allocation concealment (selection bias)	Unclear risk	Quote: "placed them in numbered, sealed envelopes" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "trained nurses who did not participate in the study prepared the drugs according to manufacturers' instructions" Judgement comment: no statement whether drugs were unlabelled and were undistinguishable from one another
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "in total, 90 patients were recruited, all of whom completed the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Park 2012 *(Continued)*

- *Weight (mean ± SD, median (IQR), median (range))*: 59.1 ± 10.4
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: 39/2/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 82.93
- *History of PONV/motion sickness (%)*: 24.39
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 117.1
- *Use of perioperative opioids (if yes, which?)*: 9 postoperative opioid usages
- *Type of surgery*: laparoscopic gynaecological surgery, mastoidectomy with tympanoplasty or thyroidectomy

Palonosetron + dexamethasone (group C)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 43
- *Received treatment (n)*: 43
- *Analysed (n)*: 43
- *Age (mean ± SD, median (IQR), median (range))*: 38.4 ± 11.4
- *Weight (mean ± SD, median (IQR), median (range))*: 56.6 ± 8.2
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: 40/3/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 93.02
- *History of PONV/motion sickness (%)*: 32.56
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 123.1
- *Use of perioperative opioids (if yes, which?)*: 8 postoperative opioid usages
- *Type of surgery*: laparoscopic gynaecological surgery, mastoidectomy with tympanoplasty or thyroidectomy

Included criteria: female; ASA I and II; 18 to 60 years of age; scheduled to undergo laparoscopic gynaecological surgery, mastoidectomy with tympanoplasty, or thyroidectomy; 2 or more risk factors, among which were female gender, non-smoking status, and history of PONV and/or motion sickness, according to the suggestion by Apfel et al

Excluded criteria: asked for patient-controlled analgesia using opioids; difficulties in receiving intubation; pregnant; psychiatric disorder; clinically ill with intestinal disease; took antiemetic drugs 24 hours preoperatively, unexpected blood loss occurred, laparoscopy was converted to a laparotomy or open surgery; patients transferred to an intensive care unit after surgery; patients who underwent day surgery; patients who were not able to communicate

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions	**Intervention characteristics** Palonosetron (group P) • *Dose*: 0.075 mg • *Time point of administration*: 5 minutes before anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg IV Palonosetron + dexamethasone (group C)

- *Duration of anaesthesia or surgery (in min; as mean or median)*: 143.4
- *Use of perioperative opioids (if yes, which?)*: fentanyl (PCA)
- *Type of surgery*: gynaecological laparoscopic surgery

Included criteria: at least 20 years of age, ASA I or II

Excluded criteria: received antiemetics, steroids, or psychoactive medications within 24 hours of study enrolment; vomiting or retching in the 24 hours preceding surgery; ongoing vomiting from gastrointestinal disease; had received emetogenic cancer chemotherapy within 4 weeks or radiotherapy within 8 weeks before study entry

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Interventions

Intervention characteristics

Ramosetron

- *Dose*: 0.3 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 20.0% (metoclopramide 10 mg)

Palonosetron

- *Dose*: 0.075 mg
- *Time point of administration*: immediately before induction of anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 14.0% (metoclopramide 10 mg)

Outcomes

Vomiting (0 to 6 hours)

- Outcome type: dichotomous outcome

Vomiting (6 to 24 hours)

- Outcome type: dichotomous outcome

Headache (0 to 48 hours)

- Outcome type: dichotomous outcome

Constipation (0 to 48 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "forty-four A.S.A. class I patients were randomly assigned to either a control or a droperidol group" Judgement comment: no information on sequence generation provided
Allocation concealment (selection bias)	Low risk	Quote: "group assignments were made by a pharmacy officer, and at no time did any physician or nurse have access to this information until the completion of the study"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the pharmacy provided for each patient an unlabeled 2-ml ampoule of either saline solution or 2.5 mg/ml of droperidol. Shortly after the surgical procedure had begun, 0.5 ml of this unknown was administered I.V. and 1.5 ml was given I.M"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: quote: "group assignments were made by a pharmacy officer, and at no time did any physician or nurse have access to this information until the completion of the study"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "three patients were excluded from the analysis because they had received unnecessary antiemetic agents in the recovery room. Three control patients and one droperidol patient received antiemetic drugs during the study for severe vomiting, but are included in the analysis"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, ASA): no; (weight): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

- *Time point of administration*: upon arrival at the operating room
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide IV

Outcomes	*Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Complete response (no PONV) in 24 hours* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** NA **Country:** Brazil **Setting:** inpatient, single-centre **Author's name:** A. J. Peixoto **Institution:** Hospital de Caridade, Brazil **Email:** NA **Address:** Departamento de Anestesiologia, Hospital de Caridade, Rua Sao Paulo 256/101, 99700-000, Erechim, RS, Brazil **Duration of study:** NA **Language:** English **Study's primary outcome:** occurrence of PONV in the first 24 hours after the procedure **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "randomized". No further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Judgement comment: quote: "a study nurse aware of the randomization status prepared the study solution and handed it to one of the anaesthesiologists who administered the drug"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement on blinding of outcome assessors provided

- *Time point of administration*: approximately 15 minutes before cessation of nitrous oxide
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: droperidol and metoclopramide most frequently given

Dolasetron (100 mg group)

- *Dose*: 100 mg
- *Time point of administration*: approximately 15 minutes before cessation of nitrous oxide
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: droperidol and metoclopramide most frequently given

Outcomes	*Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Complete response (no PONV) in 24 hours* • Outcome type: dichotomous outcome *Arrhythmia (0 to 24 hours)* • Outcome type: dichotomous outcome *Headache (0 to 24 hours)* • Outcome type: dichotomous outcome *Sedation/drowsiness (0 to 24 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** NA **Country:** USA **Setting:** outpatient, multi-centre (17) **Author's name:** B.K. Philip **Institution:** Brigham and Women's Hospital, Department of Anesthesiology **Email:** NA **Address:** Brigham and Women's Hospital, Department of Anesthesiology, Perioperative and Pain Medicine, 75 Francis St., Boston, MA 02115, USA **Duration of study:** NA **Language:** English **Study's primary outcome:** complete response, defined as no emetic episodes and no rescue antiemetic medication during the 24-hour study period **Trial registry number:** NA
Notes	Study included in a pooled analysis (secondary publication)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "all were randomized, double-blind, placebo-controlled, multicenter trials with 24-hour monitoring periods"

Control

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 40
- *Received treatment (n)*: NA
- *Analysed (n)*: 40
- *Age (mean ± SD, median (IQR), median (range))*: 31 ± 8
- *Weight (mean ± SD, median (IQR), median (range))*: 66 ± 14
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 63
- *History of PONV/motion sickness (%)*: 25/32
- *Type of general anaesthesia*: inhalational anaesthesia (N_2O, isoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 25
- *Use of perioperative opioids (if yes, which?)*: 1 µg/kg to 2 µg/kg fentanyl, 17 patients received pethidine
- *Type of surgery*: laparoscopic surgery

Included criteria: women, ASA I to III, over 16 years of age, scheduled for elective laparoscopic surgery as day patients

Excluded criteria: pregnant; had ingested alcohol, opioids, or antiemetics in the 24 hours before surgery

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions

Intervention characteristics

Metoclopramide

- *Dose*: 10 mg
- *Time point of administration*: 1 hour before induction of anaesthesia
- *Route of administration*: PO
- *Rescue antiemetics (if yes, which?)*: 32.5% (prochlorperazine)

Control

- *Dose*: 1 g lactose
- *Time point of administration*: 1 hour before induction of anaesthesia
- *Route of administration*: PO
- *Rescue antiemetics (if yes, which?)*: 37.5% (prochlorperazine)

Outcomes

Vomiting (0 to 24 hours)

- Outcome type: dichotomous outcome

Nausea (0 to 24 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "by random allocation" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "all capsules were prepared by Martindale Pharmaceuticals Pty Ltd specifically for this trial and their contents were known only to the hospital pharmacist until completion of the study. The capsules were identical in size, colour, taste and smell" Judgement comment: no information on who enrolled participants
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all capsules were prepared by Martindale Pharmaceuticals Pty Ltd specifically for this trial and their contents were known only to the hospital pharmacist until completion of the study. The capsules were identical in size, colour, taste and smell"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all hospital observations were made by the nursing staff, who had no knowledge of which treatment each patient had received"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the demographic data were similar in the three groups (Table 1). The groups were also comparable with regard to the duration of pre-operative fasting and duration of surgical procedure. There was no difference between groups in respect of previous postoperative nausea and vomiting, motion sickness or smoking"

- *Type of surgery*: major gynaecological

Included criteria: ASA I or II; non-pregnant; female; 18 to 75 years of age; 45 to 95 kg; normal hepatic, haematological, renal laboratory tests

Excluded criteria: significant laboratory or clinical evidence of renal, haematological, hepatic, or cardiovascular abnormalities; endocrine dysfunction; pregnancy or breastfeeding; receipt of antiemetic in the 24 hours before administration of study medication; required a nasogastric tube in situ postoperatively

Pretreatment: no information on distribution of baseline characteristics and potential effect modifiers presented for the different groups. Baseline characteristics (age, weight, ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): unclear

Interventions	**Intervention characteristics**

Ondansetron (4 mg group)

- *Dose*: 4mg
- *Time point of administration*: 10 minutes before starting general anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Ondansetron (8 mg group)

- *Dose*: 8mg
- *Time point of administration*: 10 minutes before starting general anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Placebo

- *Dose*: 20 mL saline
- *Time point of administration*: 10 minutes before starting general anaesthesia

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were prospectively randomized to receive..." Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...at this small dose (10). The test infusions were prepared by a nurse who did not take part in the study and were thus, blinded for the personnel performing the study. We used oxycodone (0.12 mg/kg..."
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "these nurses, blinded to the study group, performed continuous observation of the patients in the recovery room. On the ward, they observed the patients at various intervals according to their normal ward routine"
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "...receiving tropisetron were excluded because of missing data. One patient in the droperidol group and one in the placebo group discontinued the study because of profuse vomiting on the ward, and they were excluded due to their refusal to continue the study. The treatment groups were similar" Judgement comment: exclusion due to profuse vomiting. Missing data related to outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "...refusal to continue the study. The treatment groups were similar, except for the patients' height (Table 1). More than a half of the patients had a history of previous PONV with equal frequency among the groups. They experienced more nausea and vomiting" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, periopera-

- *Enrolled (n)*: -
- *Randomized (n)*: 120
- *Received treatment (n)*: NA
- *Analysed (n)*: 118
- *Age (mean ± SD, median (IQR), median (range))*: 44.3 ± 13.8
- *Weight (mean ± SD, median (IQR), median (range))*: 62.7 ± 10.6
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 78.0
- *Non-smoker (%)*: 95.8
- *History of PONV/motion sickness (%)*: 2.5
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, enflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 98.6
- *Use of perioperative opioids (if yes, which?)*: 12.7% of patients received postoperative opioids
- *Type of surgery*: elective operation

Granisetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 120
- *Received treatment (n)*: NA
- *Analysed (n)*: 118
- *Age (mean ± SD, median (IQR), median (range))*: 44.9 ± 14.9
- *Weight (mean ± SD, median (IQR), median (range))*: 62.7 ± 12.0
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 76.3
- *Non-smoker (%)*: 97.5
- *History of PONV/motion sickness (%)*: 4.2
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, enflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 112.7
- *Use of perioperative opioids (if yes, which?)*: 15.3% of patients received postoperative opioids
- *Type of surgery*: elective operation

Included criteria: ASA I or II, 18 to 75 years of age, received elective operation with endotracheal intubation and general anaesthesia

Excluded criteria: obesity; pregnancy; breastfeeding; preoperative use of antiemetics or drugs; severe cardiac, liver, renal, pulmonary, neurological, or psychiatric disease, postoperative care (?), use of gastric tube

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions	**Intervention characteristics** Ondansetron • *Dose*: 4 mg

- *Duration of anaesthesia or surgery (in min; as mean or median)*: 109
- *Use of perioperative opioids (if yes, which?)*: fentanyl at induction, intraoperatively; morphine via PCIA
- *Type of surgery*: NA (elective surgery)

Included criteria: ASA I or II, 18 to 75 years of age, patients with 3 key risk factors for PONV (female, non-smoking, postoperative opioid use)

Excluded criteria: history of PONV/motion sickness, neurological or psychiatric disease, pregnant or breastfeeding, use of antiemetics in the 24 hours before surgery, need for gastric tube postoperatively

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Interventions

Intervention characteristics

Dexamethasone + ondansetron

- *Dose*: dexamethasone 5 mg, ondansetron 4 mg
- *Time point of administration*: dexamethasone at induction of anaesthesia, ondansetron upon completion of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Dexamethasone + granisetron

- *Dose*: dexamethasone 5 mg, granisetron 3 mg
- *Time point of administration*: at induction of anaesthesia, upon completion of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: NA

Outcomes

Vomiting (0 to 24 hours)

- Outcome type: dichotomous outcome

Nausea (0 to 24 hours)

- Outcome type: dichotomous outcome

Complete response (no PONV) in 24 hours

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "instructions in numbered, sealed envelopes, randomized by random numbers generated by a computer. At the end of surgery..."
Allocation concealment (selection bias)	Unclear risk	Quote: "prepared the study drugs from instructions in numbered, sealed envelopes" Judgement comment: not stated; "sequentially numbered, opaque...envelopes (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "when the surgical procedure ended, the patients received the study drug of either metoclopramide 20 mg (Group M) or ondansetron 8 mg (Group O), intravenously from identical syringes. A nurse, not participating in the evaluation of the patients, prepared the study drugs from instructions"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "patients were interviewed by the attending nurse (who was blind to the study drug)"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "in all, 122 patients were recruited for the study. Of these, 15 patients were excluded from the analyses: six because of more extensive surgery performed, five because of inadvertent violation to the study protocol, three due to re-operations due to postoperative hemorrhage during the study period and one patient because of renal failure. Thus, 107 patients were left for analyses: 51 in the metoclopramide group (Group M) and 56 in the ondansetron group,,," Judgement comment: reason for missing outcome data described and not related to outcomes of interest

Raphael 1993 *(Continued)*

- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 22.95/14.75
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 14
- *Use of perioperative opioids (if yes, which?)*: 1.5 µg/kg fentanyl, 10 patients received morphine postoperatively
- *Type of surgery*: gynaecological laparoscopic surgery

Metoclopramide

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: NA
- *Received treatment (n)*: 62
- *Analysed (n)*: 62
- *Age (mean ± SD, median (IQR), median (range))*: 33 (23 to 57)
- *Weight (mean ± SD, median (IQR), median (range))*: 67.3 ± 9.3
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 22.58/16.13
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 13.6
- *Use of perioperative opioids (if yes, which?)*: 1.5 µg/kg fentanyl, 8 patients received morphine postoperatively
- *Type of surgery*: gynaecological laparoscopic surgery

Included criteria: undergoing elective day-case gynaecological laparoscopic surgery

Excluded criteria: pregnant, breastfeeding, taking any medication other than the oral contraceptive pill, currently being treated for nausea or vomiting

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Interventions	**Intervention characteristics** Ondansetron • *Dose*: 4 mg • *Time point of administration*: immediately before anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: prochlorperazine 12.5 mg IM Metoclopramide • *Dose*: 10 mg • *Time point of administration*: immediately before anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: prochlorperazine 12.5 mg IM
Outcomes	*Vomiting (0 to 6 hours)*

Raphael 1993 *(Continued)*

- Outcome type: dichotomous outcome

Vomiting (6 to 24 hours)

- Outcome type: dichotomous outcome

Headache (0 to 24 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Identification	**Sponsorship source:** this study was funded by a grant from Pullmaflex UK Ltd. **Country:** England **Setting:** outpatient, single-centre **Author's name:** J.H. Raphael **Institution:** Department of Anaesthetics, Pilgrim Hospital, Boston, Lincolnshire PE21 9QS **Email:** NA **Address:** Department of Anaesthetics, Pilgrim Hospital, Boston, Lincolnshire PE21 9QS **Duration of study:** NA **Language:** English **Study's primary outcome:** NA **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "the study was conducted in a double-blind manner with coded ampoules and restricted and stratified randomization was used" Judgement comment: no detailed information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "the study was conducted in a double-blind manner with coded ampoules and restricted and stratified randomization was used, with sealed envelopes, to ensure treatment groups of the same size and an equal number of patients with previous PONV in each group" Judgement comment: not stated; "sequentially numbered, opaque" envelopes (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "double-blind" Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias)	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")

Raphael 1993 *(Continued)*

All outcomes		
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "one hundred and six patients (86%) completed the questionnaire: 50 in the ondansetron group and 56 in the metoclopramide group. Of the patients who failed to complete the questionnaire, the proportion in each group with no nausea and vomiting in the first 6 h was similar to that found in those who did complete the questionnaire" Quote: "sixty-one patients received ondansetron and 62 received metoclopramide. One patient was excluded from the study after randomization because additional atropine was administered during operation to correct a bradycardia"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no significant differences between the groups in age, body weight, previous history of PONV, history of motion sickness, grade of anaesthetist, duration of anaesthesia or administration of postoperative opioid drugs" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Setting: outpatient, single-centre

Author's name: B.K. Reeve

Institution: Department of Anesthesia, St. Joseph's Hospital, Hamilton, Canada

Email: acescholes@yahoo.com

Address: Department of Anesthesia, St. Joseph's Hospital, 50 Charlton Avenue East, Hamilton, Ontario L8N 4A6, Canada

Duration of study: October 1998 to December 2000

Language: English

Study's primary outcome: PONV

Trial registry number: NA

Notes	Repetitive doses of antiemetic drugs (before discharge of SSU). Outcomes are eligible only before discharge of SSU (vomiting only in PACU relevant)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "Parkinson's disease, or declined consent. Study design Patients were allocated to DCL or placebo using a computer-generated random number table kept in the pre-operative assessment clinic.Because of a previous study"
Allocation concealment (selection bias)	Low risk	Quote: "because of a previous study done at our institution which showed a difference in the incidence of nausea and vomiting according to the phase in the menstrual cycle, the study design had patients stratified into two groups with respect to the phase in the menstrual cycle at the time of their surgical procedure (group 1: day one to eight, vs group 2: day nine or greater). Drug allocation was determined by a sealed opaque package containing four pills (four tablets of DCL, or four placebo tablets)"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "drug allocation was determined by a sealed opaque package containing four pills (four tablets of DCL, or four placebo tablets)"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "data collectors were blinded to treatment allocation throughout the study" Quote: "strengths of this study design include the randomized, stratified, concealed design, using a placebo comparison with DCL. Blinding of the patients, clinicians, data collectors, investigators and biostatistician was assured until our analysis was complete"
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "a total of 146 patients were recruited in the study period (Figure 1). This was less than our calculated target of 200. Patients were stratified according to the timing of their menstrual cycle, such that 44 patients were in day zero to eight, and 102 patients were in day nine or later in their cycle. Of 146 patients enrolled in the study, 132 patients underwent tubal ligation, and surgery was cancelled in 14 patients. Of 132 patients, data were unavailable for four patients, one patient withdrew consent and one withdrew because she was breastfeeding, leaving 126 patients with full data sets for the effectiveness analysis. This population contributed to the primary effectiveness analysis. A break in protocol occurred in 11 patients in the DCL group and 13 in the placebo group; the reasons for this break in protocol were that patients

Reeve 2005 *(Continued)*

		did not take all four tablets (DCL = 10, placebo = 9), or the anesthesiologist administered preoperative antiemetics (DCL = 1, placebo = 4). Thus, 102 patients contributed to the efficacy analysis (Figure 2). The clinical and demographic characteristics" Judgement comment: dropout rate about 30%
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "the clinical and demographic characteristics of patients undergoing tubal ligation and receiving DCL and placebo were similar, except for a greater proportion reporting a history of PONV in patients receiving DCL (Table I)" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, history of motion sickness): no; (duration of anaesthesia, non-smoker, perioperative opioids): unclear; (history of PONV): yes

Reihner 2000

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 3 groups, monoprophylaxis
Participants	**Baseline characteristics** Placebo • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 72 • *Received treatment (n)*: NA • *Analysed (n)*: 71 • *Age (mean ± SD, median (IQR), median (range))*: 54 (21 to 78) • *Weight (mean ± SD, median (IQR), median (range))*: 66 (45 to 100) • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 100 • *Non-smoker (%)*: NA • *History of PONV/motion sickness (%)*: 49.30/21.13 • *Type of general anaesthesia*: inhalational anaesthesia (N_2O, isoflurane) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 100 • *Use of perioperative opioids (if yes, which?)*: fentanyl for anaesthesia, ketobemidone for postoperative pain • *Type of surgery*: breast surgery Droperidol • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 72 • *Received treatment (n)*: NA • *Analysed (n)*: 69

Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Vomiting (0 to 2 hours)* • Outcome type: dichotomous outcome *Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Complete response (no PONV) in 24 hours* • Outcome type: dichotomous outcome *Headache (0 to 24 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** supported by grants from the Karolinska Institute, The Swedish Society of Medicine, and the Swedish Cancer Fund (3948-B97-01XAB). Glaxo AB, Mölndal, Sweden provided ondansetron **Country:** Sweden **Setting:** inpatient, single-centre **Authors name:** E. Reihnér **Institution:** Department of Surgery, Karolinska Institute at Huddinge University Hospital, Huddinge, Sweden **Email:** NA **Address:** Department of Surgery, Karolinska Institute at Huddinge University Hospital, Huddinge, Sweden **Duration of study:** NA **Language:** English **Study's primary outcome:** complete response as defined by no nausea, emesis, or need to administer rescue antiemetics during the 24-hour postoperative period (designated as 'no PONV') **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "randomization was carried out according to a randomization list and split into three equally sized groups" Judgement comment: no information on sequence generation provided

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Reihner 2000 *(Continued)*

Allocation concealment (selection bias)	Low risk	Quote: "the treatment allocation codes were not disclosed until the study was finished" Quote: "randomization was carried out according to a randomization list and split into three equally sized groups" Quote: "numbered vials, with the study drugs diluted in saline to equal volumes, were prepared by the hospital pharmacy according to the randomization list" Judgement comment: central allocation
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "numbered vials, with the study drugs diluted in saline to equal volumes, were prepared by the hospital pharmacy according to the randomization list" Quote: "the treatment allocation codes were not disclosed until the study was finished" Quote: "the objective of the present investigation was to compare the efficacy of droperidol and ondansetron in the prevention of PONV in a prospective, double-blind, randomized placebo-controlled trial of patients undergoing breast surgery" Judgement comment: vials not specified as "identical"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "the objective of the present investigation was to compare the efficacy of droperidol and ondansetron in the prevention of PONV in a prospective, double-blind, randomized placebo-controlled trial of patients undergoing breast surgery" Quote: "the treatment allocation codes were not disclosed until the study was finished" Judgement comment: it is unclear who performed outcome assessment
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...considered for P < 0.05. Nine out of a total of 216 patients were excluded (six required corticosteroids during anaesthesia as a result of difficulties at intubation or bronchial asthma, and three patients received premedication and anaesthesia diverging from the protocol), one in the placebo, three in the droperidol and five in the ondansetron group. Thus, 207 women were included in the analysis"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no differences in age, weight, type or duration of surgery and duration of anaesthesia" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (non-smoker, perioperative opioids): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "randomized fashion". No further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias)	Low risk	Judgement comment: described as "double-blind"; patches (scopolamine and placebo) were identical

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Reinhart 1994 *(Continued)*

All outcomes		
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "patients were observed by a trained, blinded monitor who recorded the incidence of nausea, vomiting, and length of stay in the postanesthesia care unit (PACU) and day surgery unit (DSU) and discharge time"
Incomplete outcome data (attrition bias) All outcomes	High risk	Quote: "...overall average VAS scores. Thirty-nine patients were enrolled in the study and 32 patients completed it. Three patients (one from the active patch group and two from the placebo group) were omitted from the results due to failure to return the diary sent home with them. One patient from the placebo group was admitted to the hospital due to uncontrollable vomiting postoperatively and was discontinued from the study. Three other patients failed to wear the patch throughout the study. In two of these patients" Judgement comment: exclusion of 1 patient from the control group due to uncontrollable vomiting. Reason for exclusion related to the outcomes of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

- *Analysed (n)*: 99
- *Age (mean ± SD, median (IQR), median (range))*: 51.6 ± 12.2
- *Weight (mean ± SD, median (IQR), median (range))*: 59.8 ± 9.6
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 93.94
- *History of PONV/motion sickness (%)*: 4.04/25.25
- *Type of general anaesthesia*: inhalational anaesthesia (des-/sevoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 151
- *Use of perioperative opioids (if yes, which?)*: fentanyl intraoperatively, postoperatively via PCA
- *Type of surgery*: general, orthopaedic, gynaecological surgery

Included criteria: healthy female, 20 to 70 years of age, ASA I or II, scheduled for elective surgery under general anaesthesia and wanted to receive IV-PCA for postoperative pain control

Excluded criteria: pregnancy; body weight > 30% above ideal body weight; vomiting or retching within 24 hours before the operation; administration of antiemetics, steroids, or psychoactive medications within 24 hours before the operation

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Interventions	**Intervention characteristics** Dexamethasone (group D) • *Dose*: 5 mg, saline • *Time point of administration*: immediately after induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: (33%) metoclopramide 10 mg IV Palonosetron + dexamethasone (group PD) • *Dose*: palonosetron 0.075 mg, dexamethasone 5 mg • *Time point of administration*: immediately after induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: (21%) metoclopramide 10 mg IV
Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Vomiting (0 to 6 hours)* • Outcome type: dichotomous outcome *Vomiting (6 to 24 hours)* • Outcome type: dichotomous outcome *Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Headache (0 to 48 hours)* • Outcome type: dichotomous outcome

Identification	**Sponsorship source:** NA **Country:** Korea **Setting:** inpatient, single-centre **Author's name:** Soon Im Kim **Institution:** Department of Anesthesiology and Pain Medicine, Soonchunhyang University Hospital Seoul, Seoul, Korea **Email:** soonnim@schmc.ac.kr **Address:** Department of Anesthesiology and Pain Medicine, Soonchunhyang University Hospital Seoul, 59, Daesagwan-ro, Yongsan-gu, Seoul 140-743, Korea **Duration of study:** NA **Language:** English **Study's primary outcome:** incidence of PONV during the 0 to 24 hours postoperative period **Trial registry number:** KCT0000581
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were randomly allocated to one of the two groups according to a computer-generated random number table"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the patients and the investigator who collected the postoperative data were blinded to the randomization" Judgement comment: no information on blinding of anaesthesiologists provided
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...investigator who collected the postoperative data were blinded to the randomization" Quote: "evaluation was made by the investigator blinded to the treatment"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...(SD), numbers, or percentages. Among the 204 patients enrolled in this study, 11 were withdrawn from the study for insufficient data collection due to them being discharged before 48 hours after the operation. Data obtained from the remaining 193 patients were analyzed, with 94 patients in the D group and 99 patients in the PD group. There were no significant differences"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: KCT0000581 (retrospective registration)
Other bias	Unclear risk	Quote: "there were no significant differences between the groups with respect to patient characteristics, motion sickness, previous PONV history, smoking status, duration of surgery, duration of anesthesia, and type of surgery (Table 1)"
