	Study's primary outcome: incidence of PONV
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "using a computer-generated randomization code (Random Allocation Software Version 1.0) with block size 4"
Allocation concealment (selection bias)	Low risk	Quote: "randomization was performed before the induction of anesthesia by an independent anesthesiologist who is responsible for patient allocation and not otherwise involved in this study. Study medications were prepared by an anesthetic nurse not involved in this study. Study medications consisted of (1) an identical syringe with 2 ml solution with normal saline for group R or 8 mg dexamethasone (Dexamethasone Ò; Daewon Pharm., Seoul, Korea) for group D, administered immediately after the induction of anesthesia and (2) a syringe with 2 ml solution with 0.3 mg ramosetron (Nasea Ò injectable; Astellas Pharma Inc., Tokyo, Japan) which was injected at the end of surgery. Syringes were labeled with the patient's inclusion number and passed to the anesthesiologist"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "patients, anesthesiologists, and outcome assessors were blinded to group assignment"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...and outcome assessors were blinded to group assignment" Quote: "by a nursing staff blinded to treatment assignment"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "seventy six patients were randomized. Three patients (2 patients from R group and 1 patient from D group) were eliminated due to conversion to open cholecytectomy and 1 patient was excluded from the analysis due to protocol violation (ondansetron administration instead of metoclopramide as a rescue antiemetic)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: KCT0000267 (retrospective registration)
Other bias	Low risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Other bias	Unclear risk	Judgement comment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, history of motion sickness): no; (history of PONV, non-smoker, duration of anaesthesia, perioperative opioids): unclear

Sah 2009

Study characteristics

Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis and combination prophylaxis
Participants	**Baseline characteristics** Ondansetron + scopolamine • *Assessed for eligibility (n)*: - • *Enrolled (n)*: -

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sah 2009 *(Continued)*

- *Randomized (n)*: 63
- *Received treatment (n)*: NA
- *Analysed (n)*: 61
- *Age (mean ± SD, median (IQR), median (range))*: 38.4 ± 12.2
- *Weight (mean ± SD, median (IQR), median (range))*: 67.7 ± 16.02
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 88.52
- *History of PONV/motion sickness (%)*: 47.54/36.07
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 219.63
- *Use of perioperative opioids (if yes, which?)*: intraoperative and postoperative fentanyl (µg), oral opioids (%) (NA, 49, 48)
- *Type of surgery*: plastic surgery

Ondansetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 63
- *Received treatment (n)*: NA
- *Analysed (n)*: 58
- *Age (mean ± SD, median (IQR), median (range))*: 43.7 ± 12.0
- *Weight (mean ± SD, median (IQR), median (range))*: 70.0 ± 17.02
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 98.28
- *Non-smoker (%)*: 89.66
- *History of PONV/motion sickness (%)*: 53.44/32.76
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 208.21
- *Use of perioperative opioids (if yes, which?)*: intraoperative and postoperative fentanyl (µg), oral opioids (%) (NA, 43, 43)
- *Type of surgery*: plastic surgery

Included criteria: ASA I and II, undergoing outpatient plastic surgery, at high risk of PONV (at least 3 of the following risk factors: female gender, previous history of PONV or motion sickness, non-smoking status, use of postoperative opioids)

Excluded criteria: NA

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions	**Intervention characteristics** Ondansetron + scopolamine • *Dose*: ondansetron 4 mg, scopolamine 1.5 mg • *Time point of administration*: ondansetron approximately 30 minutes before end of surgery, scopolamine 2 hours before surgery • *Route of administration*: ondansetron IV, scopolamine transdermal • *Rescue antiemetics (if yes, which?)*: 18.03% (PACU) Ondansetron

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sah 2009 *(Continued)*

- *Dose*: ondansetron 4 mg, placebo patch
- *Time point of administration*: ondansetron approximately 30 minutes before end of surgery, placebo patch 2 hours before surgery
- *Route of administration*: ondansetron IV, placebo transdermal
- *Rescue antiemetics (if yes, which?)*: 25.86% (PACU)

Outcomes	*Vomiting (3 to 4 hours)* • Outcome type: dichotomous outcome *Sedation/drowsiness (0 to 24 hours)* • Outcome type: dichotomous outcome *Visual disturbances (visual change, 0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** supported in party by Baxter HealthCare, Deerfield, IL, which provided the transdermal scopolamine and placebo patches used int his study **Country:** USA **Setting:** outpatient, single-centre **Author's name:** Neera Sah **Institution:** Department of Anesthesiology, Magee Womens Hospital and the University of Pittsburgh, Pittsburgh, USA **Email:** sahxnb@anes.upmc.edu **Address:** Department of Anesthesia, St. Margaret'sHospital, Pittsburgh, PA 15215 USA **Duration of study:** NA **Language:** English **Study's primary outcome:** incidence of PONV **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "all patients were randomized via computer-generated table of random numbers, to receive either a TDS or placebo patch two hours before surgery"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the placebo and TDS patches were dispensed by a pharmacist who was not directly involved in patient care"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sah 2009 *(Continued)*

		Judgement comment: no statement on identical appearance of the placebo patch
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "...were recorded preoperatively, on admission to recovery, and every hour thereafter until discharge from the hospital by anesthesia and recovery room personnel" Judgement comment: no information on blinding of outcome assessors provided
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...chi-square analysis. A total of 126 patients, 63 in each group, were enrolled in the study. Two patients in the TDS group and one in the placebo group were excluded from the study for lack of follow-up. Another 4 patients in the placebo group were excluded from the study: one patient did not require general anesthesia, one had a positive pregnancy test, the trachea of one patient could not be intubated, and one patient scratched off the patch. Both groups were similar..."
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "both groups were similar with respect to demographic data, number of risk factors, duration of surgery, and duration of hospital stay, as summarized in Table 1" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Sanchez Rodriguez 2010

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis
Participants	**Baseline characteristics** Placebo • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 105 • *Received treatment (n)*: NA • *Analysed (n)*: 105 • *Age (mean ± SD, median (IQR), median (range))*: 36.3 ± 7.3 • *Weight (mean ± SD, median (IQR), median (range))*: 70.5 ± 7.7 • *BMI (mean ± SD, median (IQR), median (range))*: 26.2 ± 3.0 • *ASA I/II/III/IV (n)*: 63/42/0/0 • *Gender (female in %)*: 61.90 • *Non-smoker (%)*: NA • *History of PONV/motion sickness (%)*: NA • *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 105.3

Sanduende 2007 *(Continued)*

- *Non-smoker (%)*: 80
- *History of PONV/motion sickness (%)*: 4/NA
- *Type of general anaesthesia*: TIVA (remifentanil, propofol)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 93
- *Use of perioperative opioids (if yes, which?)*: 1640 µg remifentanil intraoperative, 0.8 mg morphine postoperative 0 to 6 hours, 0.4 mg morphine postoperative 6 to 24 hours
- *Type of surgery*: laparoscopic cholecystectomy

Droperidol + dexamethasone

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 25
- *Received treatment (n)*: 25
- *Analysed (n)*: 25
- *Age (mean ± SD, median (IQR), median (range))*: 59 ± 17
- *Weight (mean ± SD, median (IQR), median (range))*: 73 ± 13
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 88
- *Non-smoker (%)*: 92
- *History of PONV/motion sickness (%)*: 20/NA
- *Type of general anaesthesia*: TIVA (remifentanil, propofol)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 84
- *Use of perioperative opioids (if yes, which?)*: 1351 µg remifentanil intraoperative, 1.0 mg morphine postoperative 0 to 6 hours, 0.0 mg morphine postoperative 6 to 24 hours
- *Type of surgery*: laparoscopic cholecystectomy

Dexamethasone

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 25
- *Received treatment (n)*: 25
- *Analysed (n)*: 25
- *Age (mean ± SD, median (IQR), median (range))*: 51 ± 13
- *Weight (mean ± SD, median (IQR), median (range))*: 76 ± 14
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 68
- *Non-smoker (%)*: 76
- *History of PONV/motion sickness (%)*: 8/NA
- *Type of general anaesthesia*: TIVA (remifentanil, propofol)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 88
- *Use of perioperative opioids (if yes, which?)*: 1928 µg remifentanil intraoperative, 2.9 mg morphine postoperative 0 to 6 hours, 0.0 mg morphine postoperative 6 to 24 hours
- *Type of surgery*: laparoscopic cholecystectomy

Included criteria: ASA I to III, 18 to 75 years of age, undergoing elective laparoscopic cholecystectomy

Excluded criteria: pregnancy, Parkinson's disease, history of adverse reactions with neuroleptics, prolonged QT in the preoperative electrocardiogram (ECG) or prolonged pecibility (hypokalaemia, hypocalcaemia, cerebrovascular disease, anorexia; treatment with antiarrhythmic, macrolide, or antagonist of 5-HT3 receptors), obesity (weight superior to 40% of the ideal person), slowed gastric emptying, neuropathy, amyloidosis, allergy to study drugs

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "randomization was performed with a 1:1 ratio using a computer-generated, random allocation"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Segelman 2016 *(Continued)*

Allocation concealment (selection bias)	Unclear risk	Quote: "sequence concealed in consecutively numbered sealed envelopes" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "at the time of inclusion, an envelope was opened and a syringe with the intervention substance was prepared by a nurse not otherwise involved in data collection or care of the patients. The patients, care providers, and data collectors were blinded to the drug in use"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "data collectors were blinded"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "thus, 74 patients were randomized. All patients were operated with an arthroscopic partial meniscus resection without any perioperative complications. The clinical characteristics are presented in Table 1. Thirty-three patients received betamethasone and 40 received placebo. One patient randomized to the betamethasone group did not receive the study drug due to the start of surgery being delayed. Follow-up was possible for all patients except for one in the placebo group. In total, 33 patients in the betamethasone group and 39 in the placebo group were analyzed"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: EUCTR2009-014717-27 (prospective registration). The prospectively registered primary outcome (pain) was reported in the final study. No time frame for outcome assessment was prespecified within the protocol. The primary outcome was not PONV-related
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, ASA): no; (weight): unclear. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Study characteristics

Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, combination prophylaxis
Participants	**Baseline characteristics** Palonosetron + dexamethasone (group I) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 45 • *Received treatment (n)*: NA

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sharma 2015 *(Continued)*

- *Analysed (n)*: 45
- *Age (mean ± SD, median (IQR), median (range))*: 37.8 ± 8.5
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: balanced anaesthesia (isoflurane, N_2O, analgesic not specified)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 119.7
- *Use of perioperative opioids (if yes, which?)*: NA
- *Type of surgery*: laparoscopic hysterectomy

Ondansetron + dexamethasone (group II)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 45
- *Received treatment (n)*: NA
- *Analysed (n)*: 45
- *Age (mean ± SD, median (IQR), median (range))*: 39.1 ± 8.8
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: balanced anaesthesia (isoflurane, N_2O, analgesic not specified)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 118.0
- *Use of perioperative opioids (if yes, which?)*: NA
- *Type of surgery*: laparoscopic hysterectomy

Included criteria: 30 to 50 years of age, ASA I or II, posted for elective laparoscopic hysterectomy under general anaesthesia

Excluded criteria: procedure refusal; receiving antiemetics, steroids, or psychoactive medications within 24 hours of study initiation; vomiting or retching in the 24 hours before surgery; cancer chemotherapy within the last 4 weeks; ongoing vomiting from gastrointestinal disease; allergy to NSAIDs; bronchial asthma

Pretreatment: baseline characteristics (age, ASA): no; (weight, BMI): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

Interventions	**Intervention characteristics** Palonosetron + dexamethasone (group I) • *Dose*: palonosetron 0.075 mg, dexamethasone 8 mg • *Time point of administration*: before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: (4%) metoclopramide 10 mg IV Ondansetron + dexamethasone (group II) • *Dose*: ondansetron 4 mg, dexamethasone 8 mg • *Time point of administration*: before induction of anaesthesia

Sharma 2015 *(Continued)*

	• *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: (20%) metoclopramide 10 mg IV
Outcomes	*Vomiting (0 to 2 hours)* • Outcome type: dichotomous outcome *Vomiting (2 to 6 hours)* • Outcome type: dichotomous outcome *Mortality (0 to 48 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 48 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** no funding was received for this work **Country:** India **Setting:** inpatient, single-centre **Author's name:** Anish N.G. Sharma **Institution:** Department of Anaesthesiology, KVG Medical College and Hospital, Karnataka, India **Email:** anish84guthu@gmail.com **Address:** NA **Duration of study:** NA **Language:** English **Study's primary outcome:** incidence of nausea and vomiting during the first 24 hours after anaesthesia and up to 48 hours **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomized into two groups of 45 patients each according to the sealed envelope technique" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "according to the sealed envelope technique" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sharma 2015 *(Continued)*

Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "no patients were later excluded from the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "patients in the two groups had a similar demographic profile, and no patients were later excluded from the study. Baseline hemodynamic data were also similar in both groups. Table 1 and 2 shows age distribution and duration of surgery in both groups" Judgement comment: baseline characteristics (age, ASA): no; (weight, BMI): unclear. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "the patients were randomly allocated to receive one of the three regimens" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the intravenous medications were coded and given 5 minutes prior to surgery" Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "24 hours (every 6 hours) after anesthesia were gathered and recorded by a trained investigator with no knowledge of which treatment the patients had received..."
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "the characteristics of the patients in the three treated groups are shown in table 1" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, non-smoker, history of PONV/motion sickness, perioperative opioids): no; (duration of anaesthesia): yes

Adverse events (general notes in the publication, 120 hours' observation)

- Outcome type: general notes on side effects

Identification	**Sponsorship source:** funding for this study was provided by GlaxoSmithKline (NCT00108095), Research Triangle Park, North Carolina, and Endo Pharmaceuticals, Chadds Ford, Pennsylvania **Country:** USA **Setting:** NA, multi-centre (53) **Author's name:** Neil K. Singla **Institution:** Lotus Clinical Research Inc., Huntington Hospital, Pasadena, California, USA **Email:** neil@lotuscr.com **Address:** Lotus Clinical Research Inc., 100 West California Boulevard, Pasadena, California 91105, USA **Duration of study:** NA **Language:** English **Study's primary outcome:** complete response during 24 hours **Trial registry number:** NCT00108095
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomly assigned to one of five treatments" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "approximately 90% of the patients completed the study (i.e., completed all required assessments for the 24 h after the emergence from anesthesia on postoperative day 1) (table 2). The most frequent reasons for premature withdrawal were surgery being canceled or delayed, errors in randomization or dosing, and subject's decision to withdraw. Adverse events (AEs) leading to withdrawal from the study were reported in one subject in the 100 mg casopitant plus 4 mg ondansetron arm (amnesia) and two subjects in the 150-mg

Singla 2010 *(Continued)*

		casopitant- alone arm (nerve compression and anaphylactic shock). None of these AEs was considered to be related to the study drug by the investigators"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT00108095 (retrospective registration)
Other bias	Unclear risk	Quote: "demographic characteristics, including major risk factors for PONV, were well balanced among the treatment groups (table 1)" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Study grouping: 2 groups, monoprophylaxis and combination prophylaxis

Participants

Baseline Characteristics

Aprepitant + ondansetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 64
- *Received treatment (n)*: 64
- *Analysed (n)*: 64
- *Age (mean ± SD, median (IQR), median (range))*: 43.09 ± 12.45
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 50.11 ± 8.28
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 65.63
- *Non-smoker (%)*: 83.33
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (des-/sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 153.05
- *Use of perioperative opioids (if yes, which?)*: intraoperative fentanyl, postoperative morphine
- *Type of surgery*: laparoscopic bariatric surgery

Ondansetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 61
- *Received treatment (n)*: 61
- *Analysed (n)*: 60
- *Age (mean ± SD, median (IQR), median (range))*: 43.20 ± 12.70
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 48.07 ± 6.72
- *ASA I/II/III/IV (n)*: NA/NA/NA/0
- *Gender (female in %)*: 65
- *Non-smoker (%)*: 84.65
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (des-/sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 141.97
- *Use of perioperative opioids (if yes, which?)*: intraoperative fentanyl, postoperative morphine
- *Type of surgery*: laparoscopic bariatric surgery

Included criteria: morbidly obese, ASA I to III, 18 years of age or older, considered at high risk for PONV to participate in this trial. Patients were considered if they had 2 or more of the following: (1) female gender, (2) non-smoker, (3) history of motion sickness or history of previous PONV, (4) planned use of perioperative opioids

Excluded criteria: known allergy to ondansetron or aprepitant, pregnant or breastfeeding, substance abuse or significant psychiatric disease, history of chronic nausea/vomiting, taking any medication with known antiemetic properties or known interaction with the study drugs (pimozide, terfenadine, cisapride, etc.)

Pretreatment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker): no; (history of PONV/motion sickness, perioperative opioids): unclear

Interventions	**Intervention characteristics** Aprepitant + ondansetron • *Dose*: aprepitant 80 mg, ondansetron 4 mg • *Time point of administration*: aprepitant 1 hour before scheduled time of surgery, ondansetron before cessation of surgery • *Route of administration*: aprepitant PO, ondansetron IV • *Rescue antiemetics (if yes, which?)*: (42.18%) 4 mg ondansetron, 4 mg dexamethasone, 10 mg metoclopramide, 0.625 mg droperidol Ondansetron • *Dose*: 4 mg, placebo • *Time point of administration*: placebo 1 hour before scheduled time of surgery, ondansetron before cessation of surgery • *Route of administration*: placebo PO, ondansetron IV • *Rescue antiemetics (if yes, which?)*: (42.33%) 4 mg ondansetron, 4 mg dexamethasone, 10 mg metoclopramide, 0.625 mg droperidol
Outcomes	*Vomiting (0 to 4 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** Dr Ashish Sinha received a grant from “Merck, Inc., Whitehouse Station, NJ, USA” for the conduct of this study **Country:** USA **Setting:** inpatient, single-centre **Author's name:** A.C. Sinha **Institution:** Anesthesiology and Perioperative Medicine, Drexel University College of Medicine, Philadelphia, USA **Email:** Ashish.Sinha@drexelmed.edu **Address:** Anesthesiology and Perioperative Medicine, Drexel University College of Medicine, 245 N. 15th Street, MS 310, Philadelphia, PA 19102, USA **Duration of study:** August 2009 to January 2012 **Language:** English **Study's primary outcome:** incidence of vomiting within 72 hours **Trial registry number:** NCT00956215
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "were randomized using a computer-generated table into two groups"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sinha 2014 *(Continued)*

Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "as the placebo and study drug were identical in appearance, both the investigators and the patients were blinded to the patient's study group, eliminating any possibility of bias" Judgement comment: no information on blinding of anaesthesiologists
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "in the postoperative period, a blinded observer (unaware to patient classification into groups A or P) recorded VRS nausea score for all the patients at 30 min, 1, 2, 6, 24, 48, and 72 h after the surgery"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of 125 participating patients, 124 were able to complete the study. One case in the placebo group was cancelled due to technical surgical difficulties and was a surgical decision"
Selective reporting (reporting bias)	High risk	Judgement comment: NCT00956215 (prospective registration). The prospectively registered primary outcome was changed from "preventing post operative nausea or vomiting" to "incidence of vomiting" (significant result). Nausea was not a primary endpoint in the final published article (no significant result)
Other bias	Unclear risk	Quote: "all included patients were morbidly obese (body mass index (BMI) > 40 kg/m 2) with a mean BMI of 49.12±7.60 kg/m 2. On statistical analysis, the patients were evenly distributed for age, gender, race, BMI, smoking status, and type as well as length of surgery (Table 1)" Judgement comment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker): no; (history of PONV/motion sickness, perioperative opioids): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomized to either the dexamethasone, or the placebo group on the day of surgery by a sealed envelope method" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "by a sealed envelope method" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "dexamethasone or placebo was administered by the ward nurse, and the patient and clinician were blinded to this group assignment"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "nine patients were excluded, due to conversion to open procedure in 6, due to contraindications to morphine in 2, and due to difficulty in assessing pain scores because of paraparesis in 1 patient"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sistla 2009 *(Continued)*

Other bias	Unclear risk	Quote: "patient characteristics, operative variables, and variables that can influence the incidence of PONV such as sex, duration of surgery, anesthesia technique, past history of PONV, smoking, motion sickness, and perioperative opioid were well matched in both the groups" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV, perioperative opioids): no; (history of motion sickness): unclear

Smith 2008

	Study's primary outcome: incidence of PONV **Trial registry number:** NA
Notes	Two out of 3 relevant groups

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were then randomly allocated to receive VIMA supplemented by fentanyl (Group 1), or supplemented by fentanyl and dexamethasone (Group 2) or without i.v. supplement (Group 3). To ensure the even distribution of other causes of PONV, randomization was performed in two strata according to whether patients had either zero or one risk factor or two or more risk factors" Judgement comment: no information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement on allocation concealment (randomization occurred after eligibility screening and before anaesthesia)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all anaesthetics were delivered by the senior author (IS) who was unaware of the group allocation" Quote: "these study medications were prepared in two syringes by an anaesthetist not involved with the clinical care of the patient using the sealed opaque envelope technique and were identified only by study number"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "room and the day unit. Patients were assessed by a dedicated research nurse (who was unaware of intraoperative events or group allocation) at 1 and 2 h after the end of surgery and at discharge from the day unit. At each of these times"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Quote: "there were no differences in the patient characteristics and risk factors for PONV of the three treatment groups (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "the patients were randomized, by using sealed envelopes, to receive either intravenous ondansetron (4 mg) or nothing at the end of the surgery" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "patients were randomized, by using sealed envelopes" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "the assistant nurse prepared the drug after randomization and the drug was given by the anesthetist. Both the anesthetist and the nurse did not participate in the postoperative assessment" Judgement comment: personnel who administered the study drug were not blinded
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the degree of nausea, vomiting, and pain were assessed by a research student who was unaware of the treatment arm at 2 and 24 h in the postoperative period"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 68 patients were enrolled in the study. Thirty-six patients received intravenous ondansetron, whereas 32 patients did not received any prophylaxis" Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (non-smoker, perioperative opioids): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the patients were randomly allocated in a double-blind manner using computer software (Quickcalcs; Graph-Pad Inc., La Jolla, CA, USA)"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: insufficient information on allocation concealment (how was the allocated group concealed for that person who enrolled participants? SNOSE?)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind") with no statement identity of syringes
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of 63 randomized patients, 19 patients refused and 44 patients agreed to participate in this study. All 44 patients received the study medications and completed the trial after being randomized to the NK1 group"
Selective reporting (reporting bias)	High risk	Judgement comment: JPRN-UMIN000007613 (prospective registration). The prospectively registered primary outcome was changed from "frequency of PONV" to "incidence of vomiting" (significant result). Nausea was not a primary endpoint in the final published article (no significant result)
Other bias	High risk	Quote: "there were no significant differences in patient demographics or risk factors for PONV (Table 1). The duration of surgery, duration of anaesthesia, and intraoperative remifentanil use were not significantly different between the two groups (Table 2)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, perioperative opioids): no; (history of PONV/motion sickness): yes

- *Weight (mean ± SD, median (IQR), median (range))*: 60.6 ± 5.9
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 92.68
- *History of PONV/motion sickness (%)*: 7.3/0
- *Type of general anaesthesia*: balanced anaesthesia (desflurane, remifentanil)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 142.2
- *Use of perioperative opioids (if yes, which?)*: intraoperative remifentanil, no postoperative opioids
- *Type of surgery*: thyroid surgery

Included criteria: 20 to 65 years of age, ASA I or II, undergoing thyroid surgery

Excluded criteria: history of intolerance or allergy to any drugs used in the study, gastrointestinal disease, motion sickness, postoperative emesis, obesity (body mass index > 35 kg/m^2), cardiovascular or respiratory disease, alcohol or opioid dependence, renal or hepatic functional impairment, pregnant, menstruating, had taken another antiemetic drug or a systemic steroid 24 hours before surgery

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Interventions

Intervention characteristics

Control (group C)

- *Dose*: 0.9% NaCl
- *Time point of administration*: immediately after anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV

Dexamethasone (group D)

- *Dose*: 10 mg
- *Time point of administration*: immediately after anaesthesia
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV

Song 2013 *(Continued)*

	Ramosetron (group R) • *Dose*: 0.3 mg • *Time point of administration*: immediately after anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV
Outcomes	*Vomiting (6 to 12 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 48 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** this study was supported by Wonkwang University 2012 **Country:** Korea **Setting:** inpatient, single-centre **Author's name:** Cheol Lee **Institution:** Department of Anesthesiology and Pain Medicine, Wonkwang University School of Medicine **Email:** ironyii@wonkwang.ac.kr **Address:** Department of Anesthesiology and Pain Medicine, Wonkwang University School of Medicine, 344-2 Sinyong-dong, Iksan 570-711, Korea **Duration of study:** NA **Language:** English **Study's primary outcome:** incidence and severity of nausea, incidence of vomiting, and amount of rescue antiemetic administered at 5 postoperative time intervals (T1: 0–1 hour, T6: 1–6 hours, T12: 6–12 hours, T24: 12–24 hours, and T48: 24–48 hours) **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "a total of 123 patients scheduled for thyroid surgery were randomly (envelope randomization) allocated to one of three groups" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "(envelope randomization)" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: no statement

Country: Korea

Setting: inpatient, single-centre

Author's name: Young Lan Kwak

Institution: Department of Anesthesiology and Pain Medicine; and Anesthesia and Pain Research Institute, Yonsei University College of Medicine, Seoul, Republic of Korea

Email: ylkwak@yuhs.ac

Address: Department of Anesthesiology and Pain Medicine, Anesthesia and Pain Research, Institute Yonsei University College of Medicine, 50 Yonsei-ro, Seodaemun-gu, Seoul 120-752, Republic of Korea

Duration of study: NA

Language: English

Study's primary outcome: incidence of PONV during postoperative 48 hours for patients with ABCB1 TT and non-TT genotype who received prophylactic ramosetron or palonosetron

Trial registry number: NCT02480088

Notes	Repetitive dose of study drug after 24 hours

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were assigned to either the ramosetron or the palonosetron group according to a computer-generated randomization list"
Allocation concealment (selection bias)	Low risk	Quote: "sequentially numbered opaque envelopes containing the group assignment were opened on the day of operation by a nurse who was not involved in patients' management, and the nurse prepared the study drugs as assigned" Judgement comment: SNOSE
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...by a nurse who was not involved in patients' management, and the nurse prepared the study drugs as assigned. The group assignment was blinded to both patients and investigators until the end of the study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: quote: "the group assignment was blinded to both patients and investigators until the end of the study"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "four patients in the palonosetron group were excluded because they were transferred to the intensive care unit after surgery (Fig. 1)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT02480088 (retrospective registration)
Other bias	Low risk	Quote: "patient characteristics and operative data were comparable between the ramosetron and palonosetron groups, as well as between the non-TT and TT for each group (Table 1)"

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "assign patient treatment blocks of six from a published table of random numbers; 6 patients were stratified by gender-adjusted percent ideal body weight"
Allocation concealment (selection bias)	Unclear risk	Quote: "antiemetic drug preparation and randomization were performed by an unblinded research pharmacist, using a computer program to assign patient treatment blocks of six..." Judgement comment: insufficient information on allocation concealment (unclear whether pharmacist could foresee allocation of the next patient)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "physicians, nurses, and patients were blinded to the identity of the antiemetics"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "twelve patients required conversion to open cholecystectomy and therefore were eliminated from the study; thus, 200 patients completed the protocol and are included in the analysis"

- *Duration of anaesthesia or surgery (in min; as mean or median)*: NA
- *Use of perioperative opioids (if yes, which?)*: meperidine, codeine, oxycodone postoperative
- *Type of surgery*: general, plastic, or orthopaedic surgery

Included criteria: general anaesthesia; over 18 years of age; both sexes; ASA I to III; general, plastic, or orthopaedic surgery (1 to 5 hours); patch had to be applied at least 6 hours before onset of anaesthesia

Excluded criteria: procedures of the inner or middle ear; intra-abdominal procedures that would require use of a nasogastric tube or ophthalmic procedures; specific contraindication to the use of scopolamine, including a history of allergy to the drug, neurological problems, pyloric obstruction, urinary bladder neck obstruction, or narrow angle glaucoma; preoperative use of any drug with antiemetic properties or any anticholinergic drug; history of alcohol or drug abuse; psychiatric disorder

Pretreatment: baseline characteristics (age): no; (weight): unclear; (ASA): yes. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

Interventions	**Intervention characteristics** Scopolamine • *Dose*: NA • *Time point of administration*: 8 hours preoperatively until 24 hours postoperatively • *Route of administration*: transdermal • *Rescue antiemetics (if yes, which?)*: 26% (not specified) Placebo • *Dose*: placebo • *Time point of administration*: 8 hours preoperatively until 24 hours postoperatively • *Route of administration*: transdermal • *Rescue antiemetics (if yes, which?)*: 12% (not specified)
Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Subjects with any AE (0 to 24 hours)* • Outcome type: dichotomous outcome *Headache (overall, no time point)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: quote: "randomized". No further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: no statement on blinding
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	High risk	Judgement comment: quote: "two hundred and one patients were enrolled in the study and 180 successfully completed the protocol. Eighty-two of the 201 patients entered into the study were not evaluated for efficacy (42 placebo, 42 TS scopolamine). The majority of the patients removed from the study were excluded because of inadvertent use of medications, especially antihistamines" Reasons for missing data have been described in part. Nonetheless, 42% of all data for efficacy is missing
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Judgement comment: quote: "there was a significant difference between the two groups concerning ASA classification" Baseline characteristics (age): no; (weight): unclear; (ASA): yes. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "randomly" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "the study medications were prepared by the pharmacy in two numbered syringes (containing 5 mL of either saline or ondansetron 4 mg) and were administered IV just before induction of anesthesia (Syringe 1) and at the end of the operation (Syringe 2). Group I received saline (Syringe 1) and saline (Syringe 2), Group II received ondansetron 4 mg (Syringe 1) and saline (Syringe 2), and Group III received saline (Syringe 1) and ondansetron 4 mg (Syringe 2). All patients received a standardized" Judgement comment: it is not stated that syringes were sequentially numbered and of identical appearance
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...treatment of their emetic symptoms. The administration of rescue antiemetic drugs was determined by the PACU nurse who was blinded to the prophylactic antiemetic treatment. A second rescue antiemetic..."

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sun 1997 *(Continued)*

Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...ambulatory surgery unit) were recorded. The incidence of PONV was assessed at 30-min intervals in the postanesthesia care unit (PACU) by an investigator who was blinded to the prophylactic antiemetic treatment. An emetic episode was defined..."
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	Quote: "complete 24-h follow-up data were available for 63 patients" Judgement comment: no missing outcome data for early outcomes (PACU). Overall, 16% of all patients are missing at 24 hours. Reasons for missing data at 24 hours are not described. It can be assumed that data are missing due to the ambulatory setting and because patients were lost to follow-up. All other data are reported
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness, perioperative opioids): no; (non-smoker): unclear; (history of PONV): yes

Included criteria: ASA I and II, scheduled for laparoscopic surgery (laparoscopic cholecystectomy or minor gynaecological laparoscopic surgery)

Excluded criteria: preoperative nausea or vomiting requiring therapy; current use of antiemetics, benzodiazepines, or phenothiazine derivatives; previous dyskinetic reactions to droperidol; previous allergy to any of the drugs involved in the study; history of epilepsy; gastrointestinal reflux; liver or renal impairment; use of prostaglandins or ergometrine before or during the procedure

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

Interventions

Intervention characteristics

Ondansetron

- *Dose*: 4 mg
- *Time point of administration*: immediately after induction of anaesthesia and before surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 4.48% (droperidol 1.25 mg IV)

Droperidol

- *Dose*: 75 µg/kg
- *Time point of administration*: immediately after induction of anaesthesia and before surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 2.99% (droperidol 1.25 mg IV)

Outcomes

Vomiting (6 to 12 hours)

- Outcome type: dichotomous outcome

Extrapyramidal symptoms (acute dyskinesia, 0 to 24 hours)

- Outcome type: dichotomous outcome

Sedation/drowsiness (0 to 24 hours)

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "within each [stratum], patients were randomized to one of six prophylactic treatment groups: placebo (saline) or 0.1,0.3,1.0,3.0, or 30 pg/kg RS-25259" Judgement comment: no further information on randomization method provided
Allocation concealment (selection bias)	Unclear risk	Quote: "0.1,0.3,1.0,3.0, or 30 pg/kg RS-25259. Each dose of study medication was prepared by the hospital pharmacy in a total volume of 15 mL of isotonic sodium chloride solution and was administered IV over 30 s approximately 20-30 min before the end of surgery. In the preoperative holding area..." Quote: "...dose-ranging study, 218 healthy, consenting women were assigned to one of the six treatment groups: placebo or RS-25259 0.1, 0.3, 1.0, 3.0, or 30 pg/kg" Judgement comment: no information on allocation concealment
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "0.1,0.3,1.0,3.0, or 30 pg/kg RS-25259. Each dose of study medication was prepared by the hospital pharmacy in a total volume of 15 mL of isotonic sodium chloride solution and was administered IV over..." Judgement comment: blinding of anaesthetists assumed
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding of outcome assessors ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "...+SD, numbers, or percentages. The demographic data for the six treatment groups are summarized in Table 1. The six groups were comparable with respect to age, weight, height, number of days since the start of their last menstrual cycle, percentage of patients with a history of PONV and motion sickness, and type of hysterectomy procedure (i.e., transabdominal versus vaginal). The dosages of anesthetic and analgesic drugs administered during the intraoperative and postoperative period, the duration of anesthesia and surgery, and the time to following verbal commands, and the duration of the PACU stay were also similar among all six groups. Within the first 2 h" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Tang 1998b *(Continued)*

- *Rescue antiemetics (if yes, which?)*: 42% (metoclopramide 10 mg to 20 mg IV)

Ondansetron (pre-induction)

- *Dose*: 4 mg
- *Time point of administration*: 2 to 3 minutes before induction of anaesthesia, saline at end of operation
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 32% (metoclopramide 10 mg to 20 mg IV)

Ondansetron (end of surgery)

- *Dose*: 4 mg
- *Time point of administration*: 2 to 3 minutes before induction of anaesthesia, saline at end of operation
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 20% (metoclopramide 10 mg to 20 mg IV)

Outcomes

Vomiting (0 to 24 hours)

- Outcome type: dichotomous outcome

Vomiting (PACU)

- Outcome type: dichotomous outcome

Nausea (0 to 24 hours)

- Outcome type: dichotomous outcome

Complete response (no PONV) in 24 hours

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Identification

Sponsorship source: supported in part by a grant from Glaxo Wellcome Inc., and the Ambulatory Anesthesia Research Foundation of Dallas

Country: USA

Setting: outpatient, single-centre

Author's name: Paul F. White

Institution: Department of Anesthesiology and Pain Management, University of Texas Southwestern Medical Center at Dallas, Dallas, USA

Email: pwhite@mednet.swmed.edu

Address: Department of Anesthesiology and Pain Management, University of Texas Southwestern Medical Center at Dallas, 5161 Harry Hines Blvd., CS 2.126, Dallas, TX 75235-9068, USA

Duration of study: NA

Language: English

Study's primary outcome: complete response (no vomiting, no antiemetic medication, and no withdrawal from the study during the 24-hour postoperative study period) to prophylactic antiemetic medication

Trial registry number: NA

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "subjects were randomly assigned to one of four antiemetic treatment groups using a computer-generated random number table"
Allocation concealment (selection bias)	Unclear risk	Quote: "the study medications were prepared by the pharmacy in two numbered syringes, which were identical in appearance" Judgement comment: insufficient information on allocation concealment and time point of randomization
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "double-blind study" Quote: "the study medications were prepared by the pharmacy in two numbered syringes, which were identical in appearance"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...in the PACU were recorded. Patients were contacted 24 h and 7 days after the operation by the blind investigator, who was unaware of the type of prophylactic antiemetic medication administered. Patients were asked to report..." Quote: "...severe pain or nausea. One of the investigators (JT), who was blinded as to the treatment group, recorded all the intraoperative and recovery variables, including the incidence of PONV and the need for rescue antiemetic medication. An emetic episode was defined"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "164 patients were enrolled in the study, open surgical procedures were performed in 5 patients after laparoscopy and there were protocol violations in the treatment of 3 patients. These 8 patients were excluded from the statistical analysis" Judgement comment: "the investigator could not contact six patients (4%) by telephone after surgery (two patients in Group A, three patients in Group C, and one patient in Group D), and they were excluded from the postdischarge and 24-h analyses"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "PACU = postanesthesia care unit. The four treatment groups were comparable with respect to age, weight, height, racial background, number of days since the start of their last menstrual period, duration of anesthesia and surgery, and history of PONV and motion sickness. The doses of anesthetic drugs, including propofol, perioperative opioid analgesics, muscle relaxants, and antagonists, as well as the amount of perioperative fluid infused, were not significantly different among the four groups. The number of patients requiring..." Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness, perioperative opioids): no; (non-smoker): unclear; (history of PONV): yes

Interventions

Intervention characteristics

Dexamethasone

- *Dose*: 8 mg
- *Time point of administration*: 30 to 60 minutes before skin incision
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: droperidol (first line, max. 3 × 0.5 mg/24 h) or ondansetron (second line, 4 mg)

Placebo

- *Dose*: 2 mL
- *Time point of administration*: 30 to 60 minutes before skin incision
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: droperidol (first line, max. 3 × 0.5 mg/24 h) or ondansetron (second line, 4 mg)

Outcomes

Vomiting (0 to 4 hours)

- Outcome type: dichotomous outcome

PONV (0 to 24 hours)

- Outcome type: dichotomous outcome

Subjects with any SAE (0 to 48 hours)

- Outcome type: dichotomous outcome

Subjects with any AE (0 to 48 hours)

- Outcome type: dichotomous outcome

Mortality (0 to 48 hours)

- Outcome type: dichotomous outcome

Postoperative wound infection (overall)

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were allocated to the study arms in a 1:1 ratio based on a predefined block randomization list with blocks randomly sized between 4 and 10. The randomization list was generated by the data manager (U.B.), with the hard copy stored in a secure location and the electronic version stored within the trial management software in a password-protected, encrypted fashion. During the study, only the data manager had access to the randomization list"
Allocation concealment (selection bias)	Low risk	Quote: "two to 3 days before surgery, the data manager prepared a computer-generated study medication request form based on the patient's study number. The request contained the patient's name and the treatment allocation. The form was placed in an opaque, sealed, and signed envelope and was directly delivered to the pharmacy by study personnel. Study medication was prepared according to the request form by the hospital pharmacy"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "medication was delivered in a syringe labeled with the patient's name and study number and containing either 2 mL of saline (placebo) or 2 mL of saline with 8 mg of dexamethasone (Mephameson; Mepha Pharma, Basel, Switzerland). Syringes containing saline or dexamethasone were indistinguishable. The patients and all study personnel except for the data manager were blinded to the treatment allocation"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: quote: "all study personnel except for the data manager were blinded to the treatment allocation"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Tarantino 2015 *(Continued)*

Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...Inc. All rights reserved. During the study period, 393 patients were eligible for inclusion. A total of 152 patients were included in the study and randomly allocated to the 2 study arms (Fig. 1). For the PP analysis, 27 patients (18%) were excluded because of protocol violations. In the treatment arm, 11 patients were excluded because of perioperative morphine administration (n ¼ 10) or failure to provide study treatment in time (n ¼ 1). In the control arm, 16 patients were excluded because of perioperative morphine (n = 14) or preoperative use of steroids (n = 2) (Fig. 1). The patient characteristics were well..."
Selective reporting (reporting bias)	Low risk	Judgement comment: NCT01189292 (prospective registration). The prospectively registered primary outcome (PONV) was reported in the pre-specified way in the final study report
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Teran 2007 *(Continued)*

	Study's primary outcome: incidence of PONV
Notes	Two out of 3 groups relevant (isopropyl alcohol)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "participants were randomly assigned using a table of random numbers to 1 of 3 groups"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Judgement comment: blinding of personnel impossible (different interventions)
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the PACU nurses were blinded to subject treatment group"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): unclear

Tezcan 1993

Study characteristics

Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis
Participants	**Baseline characteristics** Placebo (group P) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 15 • *Received treatment (n)*: NA • *Analysed (n)*: 15 • *Age (mean ± SD, median (IQR), median (range))*: 28.0 ± 1.6 • *Weight (mean ± SD, median (IQR), median (range))*: 65.8 ± 5.2 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 100

Tezcan 1993 *(Continued)*

- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (halothane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 33.7
- *Use of perioperative opioids (if yes, which?)*: meperidine postoperative
- *Type of surgery*: laparoscopic-gynaecological surgery

Droperidol (group D)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 15
- *Received treatment (n)*: NA
- *Analysed (n)*: 15
- *Age (mean ± SD, median (IQR), median (range))*: 30.3 ± 1.6
- *Weight (mean ± SD, median (IQR), median (range))*: 60.9 ± 2.4
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: inhalational anaesthesia (halothane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 24.3
- *Use of perioperative opioids (if yes, which?)*: meperidine postoperative
- *Type of surgery*: laparoscopic-gynaecological surgery

Included criteria: female, ASA I or II, undergoing planned laparoscopic-gynaecological surgery

Excluded criteria: hypertension, organic heart disease, intake of antiemetics in the pre-operation time

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender): no; (history of PONV/motion sickness, perioperative opioids, non-smoker): unclear; (duration of anaesthesia): yes

Interventions	**Intervention characteristics** Placebo (group P) • *Dose*: NaCl 0.9% • *Time point of administration*: right before extubation • *Route of administration*: IM • *Rescue antiemetics (if yes, which?)*: (26.6%) metoclopramide Droperidol (group D) • *Dose*: 0.04 mg/kg • *Time point of administration*: right before extubation • *Route of administration*: IM • *Rescue antiemetics (if yes, which?)*: (6.7%) metoclopramide
Outcomes	*Vomiting (0 to 2 hours)* • Outcome type: dichotomous outcome *Vomiting (2 to 12 hours)* • Outcome type: dichotomous outcome

	Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear
Interventions	**Intervention characteristics** Dexamethasone (group D) • *Dose*: 4 mg • *Time point of administration*: shortly after induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 20 mg IV Betamethasone (group B) • *Dose*: 12 mg • *Time point of administration*: shortly after induction of anaesthesia • *Route of administration*: IM • *Rescue antiemetics (if yes, which?)*: metoclopramide 20 mg IV
Outcomes	*Vomiting (0 to 6 hours, in hospital)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 72 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** NA **Country:** Norway **Setting:** outpatient, single-centre **Author's name:** Johan Raeder **Institution:** Departments of Anaesthesiology and Day Surgery, University of Oslo, Faculty Division, Ullevaal University Hospital, Oslo, Norway **Email:** johan.rader@medisin.uio.no **Address:** Department of Anaesthesia, Ullevaal University Hospital, N-0407 Oslo, Norway **Duration of study:** NA **Language:** English **Study's primary outcome:** number of patients with significant pain (defined as VAS pain score > 3) during the first postoperative day after discharge **Trial registry number:** NA
Notes	Two out of 3 groups relevant (ketorolac)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the sealed instructions were randomized according to a computer-generated list of random numbers and prepared by an assistant not otherwise participating in the study"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Thagaard 2007 *(Continued)*

Allocation concealment (selection bias)	Unclear risk	Quote: "instructions in a sealed envelope administered by a nurse not participating in any other part of the study" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "administered by a nurse not participating in any other part of the study or handling of the patients. The anaesthesiologist left the room during injection and the post-operative nursing staff were also unaware of the individual patient allocation"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the post-operative nursing staff were also unaware of the individual patient allocation"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "one hundred and seventy-nine consecutive patients fulfilled the criteria and accepted to participate in the study, no one dropped out during the stay in the unit. One hundred and sixty-three answered the questionnaires at 24 h, and 72 h (Fig. 1)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the patients were evaluated for pre-operative risk factors for nausea [i.e. travel sickness, gender, smoking habits, previous PONV (11)]" Quote: "...and 72 h (Fig. 1). The patient characteristics were similar between the three groups, except for shorter duration of surgery in the ketorolac patients (Table 1). There were no significant differences between the groups in pre-operative risk factors for nausea or pain. There was significantly less severe" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear

Thangaswamy 2010

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 3 groups, monoprophylaxis, dose-finding study
Participants	**Baseline characteristics** Placebo (group P) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 18 • *Received treatment (n)*: 18 • *Analysed (n)*: 18 • *Age (mean ± SD, median (IQR), median (range))*: 36 ± 8 • *Weight (mean ± SD, median (IQR), median (range))*: 58.3 ± 12.6 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA/NA/0/0

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the patients were randomized to one of the three groups based on a computer generated random number list"
Allocation concealment (selection bias)	Unclear risk	Quote: "the study solution to be given to the patient was concealed in a sealed envelope bearing the patient's number which was handed over by the second author to the ward nurse who was not involved in the study. The study solution was prepared by the ward nurse and administered to the patient intravenously 2 h before the start of the surgery" Judgement comment: not stated; "sequentially numbered, opaque, sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...ward nurse who was not involved in the study. The study solution was prepared by the ward nurse" Quote: "all patients were blinded to the nature of the drug administered"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "in the PACU, a blinded investigator (first author) recorded the pain scores at rest and on movement (patient was asked to log roll to one side) and PONV at 0 min, 30 min, 1, 2, 4, 8, 12, and 24 h postoperatively"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "sixty seven consecutive patients were considered for inclusion in the study. Fifty-five patients were included and randomly assigned to their treatment group (Fig. 1)" Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "all groups were comparable with regard to patient characteristics and intraoperative details (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (non-smoker): unclear; (perioperative opioids): yes

- *Duration of anaesthesia or surgery (in min; as mean or median)*: 29.7
- *Use of perioperative opioids (if yes, which?)*: 4/59 fentanyl (n/N), 43/59 tramadol (n/N), laparoscopic surgery, additionally tramadol intraoperative; postoperative codeine, dextropropoxyphen
- *Type of surgery*: outpatient gynaecological surgery

Dexamethasone + ondansetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 58
- *Received treatment (n)*: 58
- *Analysed (n)*: 58
- *Age (mean ± SD, median (IQR), median (range))*: 36.0 (mean) (19 to 53)
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 24.1 ± 3.3
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 55
- *History of PONV/motion sickness (%)*: 57
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane, N_2O)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 30.2
- *Use of perioperative opioids (if yes, which?)*: 6/58 fentanyl (n/N), 46/58 tramadol (n/N), laparoscopic surgery, additionally tramadol intraoperative; postoperative codeine, dextropropoxyphen
- *Type of surgery*: outpatient gynaecological surgery

Included criteria: ASA I or II, premenopausal female, 19 to 53 years of age, undergoing day-case gynaecological surgery

Excluded criteria: gastrointestinal, liver, or renal disease; had received any antiemetic medication within 24 hours before surgery or complained of preoperative nausea or vomiting; pregnant or lactating; body mass index > 35

Pretreatment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions

Intervention characteristics

Dexamethasone

- *Dose*: 8 mg
- *Time point of administration*: immediately after induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: cyclizine 50 mg

Ondansetron

- *Dose*: 4 mg
- *Time point of administration*: immediately after induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: cyclizine 50 mg

Dexamethasone + ondansetron

- *Dose*: dexamethasone 8 mg, ondansetron 4 mg
- *Time point of administration*: immediately after induction

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "randomization was performed by a doctor not participating in the study and by a block-randomized computer-generated method"
Allocation concealment (selection bias)	Low risk	Quote: "from the randomization list, 80 sealed non-transparent envelopes were created and numbered 1–80"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "thus, the patient, surgeon, anaesthetist, nurses in the operating room and the PACU, as well as the investigators, were unaware of the nature of the injected solution" Quote: "a randomization code 1–80 was used in the patient records. A nurse not participating in the study or care of the patient opened a sealed envelope in a closed medicine room 30–60 min before operation"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "thus, the patient, surgeon, anaesthetist, nurses in the operating room and the PACU, as well as the investigators, were unaware of the nature of the injected solution"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: 80 participants were randomized; 73 were analysed. Reason for missing outcome data: did not return questionnaire (6), not operated (1)
Selective reporting (reporting bias)	Low risk	Judgement comment: NCT01170780 (prospective registration). The prospectively registered primary outcome (pain) was reported in the pre-specified way in the final study report. The primary outcome was not PONV-related
Other bias	Low risk	Quote: "the two groups were comparable for reported variables, including type of hernia (Table 1)" Judgement comment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were randomly allocated using a computer-generated randomization list into 2 groups (n 5 30)"
Allocation concealment (selection bias)	Unclear risk	Quote: "sealed envelops containing one syringe with bupivacaine and saline or bupivacaine and dexamethasone were prepared by an anesthesiology resident not involved in this study" Judgement comment: not stated; "sequentially numbered, opaque" envelopes (SNOSE)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Tomar 2017 *(Continued)*

Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the enrolled patient, concerned anesthesiologist, and surgeon were unaware of the nature of the drug in each syringe" Quote: "sealed envelops containing one syringe with bupivacaine and saline or bupivacaine and dexamethasone were prepared by an anesthesiology resident not involved in this study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "all patients were observed postoperatively by anesthesiology resident who was unaware of the study group"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "among 60 patients, 6.67% (2 patients) in group D and 10% (3 patients) in group B were declared as failure to perceive desired effect with medications given. These 5 patients were excluded from the study (Figure 1). Hence, 57 patients were available for data analysis"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "demographic variables in terms of age, gender, body weight, and height were found to be comparable along with duration of surgery in both groups (P. 0.05) (Table 1). The groups were also comparable regarding fentanyl and propofol consumption during intraoperative period (P. 0.05) (Table 2)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker): unclear; (perioperative opioids): yes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Judgement comment: quote: "after enrolment, patients were randomly allocated (by use of sealed opaque envelopes), via permuted block method with a block of four, into two groups. 'Blocks' having equal numbers of As and Bs (A = granisetron and B = saline solution) are used, with the order of treatmends within the block being randomly permuted. A random number sequence was used to choose a particular block, which sets the allocation order to the first four subjects. Similarly, the treatment group is allocated to the next four patients in the order specified by the next randomly selected block. The process is then repeated"
Allocation concealment (selection bias)	Low risk	Judgement comment: quote: "after enrolement, patients were randomly allocated (by use of sealed opaque envelopes), via permuted block method with a block of four, into two groups"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Judgement comment: quote" "all of the study drugs were prepared and given in equal amount of 5 mL so that investigators were blinded to the drug and dose given"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Judgement comment: quote: "the nurses, without knowing the patient allocation, started continuous observation of the patients in the recovery room"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV, perioperative opioids): no; (history of motion sickness): unclear

- *Received treatment (n)*: 34
- *Analysed (n)*: 32
- *Age (mean ± SD, median (IQR), median (range))*: 58 ± 14
- *Weight (mean ± SD, median (IQR), median (range))*: 62 ± 9
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: 1/31/0/0
- *Gender (female in %)*: 65.63
- *Non-smoker (%)*: 87.5
- *History of PONV/motion sickness (%)*: 6.25
- *Type of general anaesthesia*: TIVA (propofol, remifentanil)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 513
- *Use of perioperative opioids (if yes, which?)*: 8.0 mg remifentanil intraoperative, 1 patient received 15 mg pentazocine IV postoperative
- *Type of surgery*: craniotomy

Included criteria: 20 to 80 years of age, ASA I or II, undergoing elective craniotomy under general anaesthesia

Excluded criteria: ASA III or IV, neuronal disease, abnormal liver and/or renal function, receiving another antiemetic

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioid): no

---

Interventions

Intervention characteristics

Fosaprepitant (NK1 group)

- *Dose*: 150 mg
- *Time point of administration*: before anaesthesia induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 10 mg metoclopramide

Ondansetron (ONS group)

- *Dose*: 4 mg
- *Time point of administration*: before anaesthesia induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 10 mg metoclopramide

---

Outcomes

Vomiting (0 to 24 hours)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Tsutsumi 2014 *(Continued)*

- Outcome type: dichotomous outcome

Vomiting (0 to 2 hours)

- Outcome type: dichotomous outcome

PONV (0 to 24 hours)

- Outcome type: dichotomous outcome

Complete response (no PONV) in 24 hours

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 48 hours' observation)

- Outcome type: general notes on side effects

Identification	**Sponsorship source:** this work was supported by JSPS KAKENHI Grants nos. 24791598 and 25861378 **Country:** Japan **Setting:** inpatient, single-centre **Author's name:** Yasuo M. Tsutsumi **Institution:** Department of Anesthesiology, The University of Tokushima, Japan **Email:** tsutsumi@tokushima-u.ac.jp **Address:** Department of Anesthesiology, The University of Tokushima, 3-18-15 Kuramoto, Tokushima 770-8503, Japan **Duration of study:** 1 October 2012 to 5 February 2014 **Language:** English **Study's primary outcome:** incidence of vomiting (power analysis) **Trial registry number:** JPRN-UMIN000008621
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "the patients received allocations in a randomized, double-blinded manner using a computer-generated distribution (QuickCalcs, GraphPad Inc., La Jolla, CA, USA)"
Allocation concealment (selection bias)	Unclear risk	Quote: "on the day of surgery, patients were randomized to 1 of 2 groups" Quote: "to ensure blinding among the investigators, the randomization schedule was generated by a statistician who was not involved in the clinical study" Judgement comment: insufficient information on allocation concealment (was the randomization code kept in sequentially numbered, opaque, and sealed envelopes?)
Blinding of participants and personnel (performance bias)	Low risk	Quote: "to ensure blinding among the investigators"

Tsutsumi 2014 *(Continued)*

All outcomes		
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "an anesthesiologist unaware of the patients' randomization collected the data"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "70 randomized patients, 68 received study medications and 64 completed the trial: 32 in the NK1 group and 32 in the ONS group (Figure 1)" Judgement comment: reasons for missing outcome data were reported: prolonged postoperative ventilation, loss to follow-up, abnormal liver function. Exclusions are balanced among groups
Selective reporting (reporting bias)	Unclear risk	Judgement comment: JPRN-UMIN000008621 (prospective registration). The final study report did not identify the primary outcome
Other bias	Low risk	Quote: "there was no difference in patient demographics, risk factors for PONV, duration of surgery and anesthesia, intraoperative opioid usage, or postoperative analgesic consumption between the 2 groups (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioid): no

- *Duration of anaesthesia or surgery (in min; as mean or median)*: 44
- *Use of perioperative opioids (if yes, which?)*: 143 µg fentanyl intraoperative
- *Type of surgery*: gynaecological laparoscopic surgery

Included criteria: women scheduled for elective outpatient gynaecological laparoscopic surgery

Excluded criteria: pregnant; intolerant or allergic to any of the drugs used in the study protocol; underlying gastrointestinal disease requiring active treatment; known history of vomiting or use of antiemetic drugs in the last 24 hours; body mass index > 35; concurrent use of antihistamines, phenothiazines, or drugs with known antiemetic effect; inability to ingest oral medication with a sip (approximately 30 mL) of water

Pretreatment: baseline characteristics (age): no; (ASA): unclear; (BMI): yes. Potential effect modifiers (gender, history of PONV, duration of anaesthesia, perioperative opioids): no; (non-smoker): unclear; (history of motion sickness): yes

Interventions

Intervention characteristics

Droperidol

- *Dose*: 0.625 mg
- *Time point of administration*: before induction
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: ondansetron

Dimenhydrinate

- *Dose*: 75 mg (25 mg immediate + 50 mg sustained release drug)
- *Time point of administration*: one hour before anticipated procedure time
- *Route of administration*: PO
- *Rescue antiemetics (if yes, which?)*: ondansetron

Droperidol + dimenhydrinate

- *Dose*: dimenhydrinate LA 75 mg (25 mg immediate + 50 mg sustained release drug), droperidol 0.625 mg
- *Time point of administration*: dimenhydrinate LA 1 hour before anticipated procedure time, droperidol before induction
- *Route of administration*: PO, IV
- *Rescue antiemetics (if yes, which?)*: ondansetron

Notes	Two out of 3 groups relevant

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were assigned to one of the 3 study groups using a computer-generated random number table"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement on allocation concealment
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "all syringes with propofol, metoclopramide, or placebo were prepared by the same investigator. Administration of anesthesia and drugs used in the study and intraoperative data collection were made by the other investigators blinded to the study drugs" Judgement comment: no statement on blinding of participants
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there was no significant difference among the study groups in terms of age, body weight, length, ASA group, gender, duration of operation, and anesthesia" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness): no; (history of PONV, non-smoker, perioperative opioids): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "randomly allocated to receive either a transdermal hyoscine patch (Transderm Scop, ALZA Corp.) or placebo"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Uppington 1986 *(Continued)*

		Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the placebo was a Band-aid patch (Johnson and Johnson) and each hyoscine patch was covered by a similar Band-aid for protection and so that its identity could not be distinguished from placebo by patient or assessor" Judgement comment: no information on blinding of anaesthesiologists
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the patients were visited 24, 48 and 72 hours postoperatively by an author who had not seen them pre-operatively and who had not been told which medication they had been given"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 42 patients who started the trial, four were withdrawn. Three of these received non-standard anaesthetics (extradural or spinal block), two in the hyoscine group and one in the placebo group. The other patient who was withdrawn was in the placebo group, and had been given metoclopramide prior to induction. Thus, data on 38 patients were completed"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the mean values (SD) for age were 39.9 (7.1) and 39.3 (6.3) years in the hyoscine and placebo groups respectively. The respective weights were 65.9 (6.9) and 64.6 (10.7) kg. These differences were not statistically significant" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 153.2
- *Use of perioperative opioids (if yes, which?)*: 98.7% received postoperative opioids
- *Type of surgery*: plastic surgery

Included criteria: men and women; 18 to 65 years of age; ASA I to III; considered at high risk for postoperative nausea and vomiting; undergoing ambulatory plastic surgery under general anaesthesia of at least 1 hour duration were eligible for this prospective, randomized, double-blind trial. Subjects were recruited on the day of surgery during the preoperative evaluation by study investigators (M.C.V. and R.C.R.), who were anaesthesiologists already involved in patient care. Major postoperative nausea and vomiting patient-related risk factors for inclusion in this study were (1) female gender, (2) history of postoperative complication or history of motion sickness, (3) non-smoking status, (4) postoperative use of opioids. Patients with 2 or more risk factors were eligible for the study. All patients who were scheduled for either outpatient or 23-hour observation were included in the study, as,depending on the time of day, the 2 groups of patients were interchangeable

Excluded criteria: patient refusal to participate in the study, had received other antiemetics before their procedure, history of allergy or sensitivity to study drugs, pregnancy, history of long-term opioid use (chronic pain syndrome). Women of reproductive age were routinely screened for pregnancy; patients who were pregnant were informed and excluded from the study

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Intervention characteristics

Aprepitant + ondansetron

- *Dose*: aprepitant 40 mg, ondansetron 4 mg
- *Time point of administration*: aprepitant 2 hours before scheduled operation, ondansetron after endotracheal intubation
- *Route of administration*: oral aprepitant, IV ondansetron
- *Rescue antiemetics (if yes, which?)*: NA (4 mg ondansetron, 4 mg dexamethasone, 10 mg metoclopramide, 6.25 mg promethazine, 1 mg granisetron, 10 mg prochlorperazine, transdermal scopolamine patch, 0.625 mg droperidol, 12.5 mg dolasetron)

Ondansetron

- *Dose*: 4 mg
- *Time point of administration*: placebo 2 hours before scheduled operation, ondansetron after endotracheal intubation
- *Route of administration*: oral placebo, IV ondansetron
- *Rescue antiemetics (if yes, which?)*: NA (4 mg ondansetron, 4 mg dexamethasone, 10 mg metoclopramide, 6.25 mg promethazine, 1 mg granisetron, 10 mg prochlorperazine, a transdermal scopolamine patch, 0.625 mg droperidol, 12.5 mg dolasetron)

Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 48 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** grant support, including study drug and placebo, was provided by Merck Healthcare, Whitehouse Station, NJ, USA, and the Department of Anesthesiology, Magee-Womens Hospital, Pittsburgh, PA, USA. Study authors have no other disclosures to report in relation to the content of this article **Country:** USA **Setting:** outpatient, single-centre **Author's name:** Manuel C. Vallejo **Institution:** Department of Anesthesiology, Magee-Womens Hospital of the University of Pittsburgh, Medical Center, USA **Email:** vallejomc@anes.upmc.edu **Address:** Medical Center 300 Halket Street Pittsburgh, PA 15213, USA **Duration of study:** NA **Language:** English **Study's primary outcome:** incidence of vomiting at any time within the first 48 hours after surgery **Trial registry number:** PRO07070325
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "...one of the study investigators. Patients were randomized by a computer-generated number table(http://www.graphpad.com/ quickcalcs/randomize1.cfm), which the pharmacy department used to assign patients to one of two groups (group A: 40 mg of oral aprepitant plus 4 mg of intravenous ondansetron; or group B: oral placebo plus intravenous 4 mg of ondansetron intravenously). The oral aprepitant or placebo..."
Allocation concealment (selection bias)	Low risk	Judgement comment: central allocation
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the placebo and study drug were identical in appearance; hence, both the investigators and the patients were blinded to the patient's study group, eliminating any potential bias"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "a study investigator blinded to the treatment group recorded the occurrence of nausea and vomiting in the preoperative period, on admission to the postanesthesia care unit, and at hourly intervals until the patient was discharged from the hospital. While at home, patients rated their nausea according to the same scale, indicated whether they retched or vomited, and recorded in a structured diary which analgesics they consumed. Patients made diary entries every 4 hours while awake for up to 24 hours after the first day of

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Vallejo 2012 *(Continued)*

		surgery, and every 8 hours while awake during the second day after surgery (48 hours). The information from the patient diary was obtained through a follow-up telephone interview by the principal investigator"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 150 patients were enrolled, and only one patient was lost during follow-up (did not answer follow-up telephone calls or return daily log). Data for this subject were included in the results until hospital discharge. All other patients completed their daily log"
Selective reporting (reporting bias)	High risk	Judgement comment: PRO07070325 (prospective registration). The prospectively registered primary outcome (number of participants having postoperative emesis and nausea) was changed in the final study report (incidence of vomiting only) and "nausea" moved to secondary endpoints in the final study article
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Veneziani 2006

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 4 groups, monoprophylaxis and combination prophylaxis
Participants	**Baseline characteristics** Placebo (group P) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: NA • *Received treatment (n)*: NA • *Analysed (n)*: 25 • *Age (mean ± SD, median (IQR), median (range))*: 47.7 ± 14.1 • *Weight (mean ± SD, median (IQR), median (range))*: 63.4 ± 11.6 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA/NA/0/0 • *Gender (female in %)*: 100 • *Non-smoker (%)*: NA • *History of PONV/motion sickness (%)*: NA • *Type of general anaesthesia*: balanced anaesthesia (N_2O, sevoflurane, fentanyl) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 78.89 • *Use of perioperative opioids (if yes, which?)*: intraoperative fentanyl 1.5 µg/kg + 50 µg/h, morphine PCA • *Type of surgery*: major gynaecological surgery by laparotomy Dehydrobenzperidol (group DBP) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: NA • *Received treatment (n)*: NA • *Analysed (n)*: 25

- *Age (mean ± SD, median (IQR), median (range))*: 55.4 ± 16.7
- *Weight (mean ± SD, median (IQR), median (range))*: 64.6 ± 8.95
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: balanced anaesthesia (N_2O, sevoflurane, fentanyl)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 72.78
- *Use of perioperative opioids (if yes, which?)*: intraoperative fentanyl 1.5 µg/kg + 50 µg/h, morphine PCA
- *Type of surgery*: major gynaecological surgery by laparotomy

Dolasetron (group A)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: NA
- *Received treatment (n)*: NA
- *Analysed (n)*: 25
- *Age (mean ± SD, median (IQR), median (range))*: 52.5 ± 13.7
- *Weight (mean ± SD, median (IQR), median (range))*: 61.5 ± 9.25
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: balanced anaesthesia (N_2O, sevoflurane, fentanyl)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 77.94
- *Use of perioperative opioids (if yes, which?)*: intraoperative fentanyl 1.5 µg/kg + 50 µg/h, morphine PCA
- *Type of surgery*: major gynaecological surgery by laparotomy

Dexamethasone + dolasetron (group AD)

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: NA
- *Received treatment (n)*: NA
- *Analysed (n)*: 25
- *Age (mean ± SD, median (IQR), median (range))*: 47.9 ± 14.1
- *Weight (mean ± SD, median (IQR), median (range))*: 64.8 ± 14.3
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: balanced anaesthesia (N_2O, sevoflurane, fentanyl)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 75.00
- *Use of perioperative opioids (if yes, which?)*: intraoperative fentanyl 1.5 µg/kg + 50 µg/h, morphine PCA
- *Type of surgery*: major gynaecological surgery by laparotomy

Included criteria: women, ASA classes I and II, 25 to 80 years of age, about to undergo major gynaecological surgery by laparotomy

Excluded criteria: ASA III; renal and hepatic insufficiency; pregnancy; current menstruation; body weight > 50% of ideal weight; vomiting or nausea in the 24 hours before surgery; psychoactive or

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "participants were randomly assigned to four groups based on the type of intravenous antiemetic therapy received" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "group A were given a bolus with dolasetron 12.5 mg at time of suturing wounds; Group AD received dexamethasone 8 mg at entry in the operating theatre plus dolasetron 12.5 mg in a bolus at the beginning of suturing. The various timings of administration were compatible with the pharmacokinetic/pharmacodynamic differences of the drugs used" Judgement comment: no blinding of anaesthetists due to different time points of administration
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the study observation period was 24 hours post-surgery during which an investigator (blind as to the type of treatment received) recorded the onset of episodes of nausea associated or not to vomiting, the number of such episodes and whether isolated, prolonged and/or repeated"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the sample demographic characteristics and the length of treatments, expressed as mean and standard deviation are shown on table 2. Groups were matched for age, body weight, SPAIAS score and duration of surgery" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia): no; (history of PONV/motion sickness, non-smoker, perioperative opioids): unclear

Voigt 2011-2 *(Continued)*

	Study's primary outcome: primary outcome in this study was the incidence of nausea, emesis, or both, in the early (0 to 2 hours) and late (2 to 24 hours) postoperative periods **Trial registry number:** NA
Notes	Two sub-studies (inhalational, TIVA) with 3 groups each

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomized" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "to 6 subgroups of 80 patients each by sealed envelope assignment" Judgement comment: not stated; "sequentially numbered, opaque, and sealed envelopes" (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	High risk	Quote: "the nurses in the recovery room and ward were unblinded as to the prophylactic combination administered preoperatively"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "double-blinded" Judgement comment: insufficient information on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "outcome data were complete for all 480 patients"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight, ASA): unclear. Potential effect modifiers (gender, non-smoker, history of PONV): no; (history of motion sickness, duration of anaesthesia, perioperative opioids): unclear

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "patients were randomized to receive either metoclopramide 20 mg or placebo according to a randomized, block design" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: insufficient information on blinding ("double-blind")
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 119 patients were enrolled with 109 patients considered eligible for efficacy analysis. Ten patients were excluded from the statistical analysis due to protocol violations. Of these, six patients underwent other surgical procedures, two patients received unauthorized medications, and two patients did not receive the study drug (one in each group). The two patient groups (elective closed laparoscopic gynecological surgery and elective closed laparoscopic cholecystectomy) were combined since the laparoscopic procedure itself is a primary inciting event for the development of PONV"

- *Duration of anaesthesia or surgery (in min; as mean or median)*: 145
- *Use of perioperative opioids (if yes, which?)*: 300 µg fentanyl perioperative, morphine 1 hour (14 mg) and 2 hours (3 mg) in PACU and in ward (17 mg)
- *Type of surgery*: abdominal total hysterectomy

Included criteria: adult female, ASA I and II, 35 to 45 years of age, scheduled for abdominal total hysterectomy under general anaesthesia

Excluded criteria: history of motion sickness or gastrointestinal disorder, had received antiemetics within 48 hours before surgery

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness, perioperative opioids): no; (history of PONV, non-smoker): unclear

Interventions	**Intervention characteristics** Dexamethasone (group 1: pre-induction) • *Dose*: 10 mg • *Time point of administration*: dexamethasone 1 minute before induction of anaesthesia, saline at end of administration of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 1.25 mg IV droperidol; 0 to 2 hours: 8%, 2 to 24 hours: 13% Dexamethasone (group 2: end of anaesthesia) • *Dose*: 10 mg • *Time point of administration*: saline 1 minute before induction of anaesthesia, dexamethasone at end of administration of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 1.25 mg IV droperidol; 0 to 2 hours: 30%, 2 to 24 hours: 15% Placebo (group 3) • *Dose*: saline • *Time point of administration*: saline 1 minute before induction of anaesthesia, saline at end of administration of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: 1.25 mg IV droperidol; 0 to 2 hours: 35%, 2 to 24 hours: 38%
Outcomes	*Vomiting (0 to 2 hours)* • Outcome type: dichotomous outcome *Vomiting (2 to 24 hours)* • Outcome type: dichotomous outcome
Identification	**Sponsorship source:** NA **Country:** Taiwan

Duration of study: NA

Trial registry number: NA

Study's primary outcome: proportion of participants requiring rescue IV droperidol

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "in the preoperative holding area, patients were allocated randomly to one of three groups (n 40 each) by using a computer-generated random number table"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the randomized process and the identity of the study drug were blinded from the patients, the anesthesiologists"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...during surgery, and the investigators who collected the postoperative data" Quote: "the randomized process and the identity of the study drug were blinded from the patients, the anesthesiologists"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "all 120 patients completed the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "there were no significant differences among the three groups with respect to age, weight, height, last menstrual period, types of surgery, duration of anesthesia and surgery, and the total of perioperative fentanyl doses (Table 1)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of motion sickness, perioperative opioids): no; (history of PONV, non-smoker): unclear

Warriner 1997 *(Continued)*

- *Use of perioperative opioids (if yes, which?)*: 274 ± 6 µg fentanyl
- *Type of surgery*: total abdominal hysterectomy (TAH)

Included criteria: non-pregnant, ASA I or II, women between 18 and 70 years of age, booked for total abdominal hysterectomy (TAH) under general anaesthesia

Excluded criteria: previous or current history of serious cardiovascular, respiratory, metabolic, hepatic, or renal dysfunction; had used medication known to have potential antiemetic efficacy within 24 hours before study drug administration

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness, perioperative opioids): no; (non-smoker): unclear

Interventions	**Intervention characteristics** Placebo • *Dose*: NA • *Time point of administration*: 1 to 2 hours before induction of anaesthesia • *Route of administration*: oral • *Rescue antiemetics (if yes, which?)*: 60% (NA) Dolasetron (25 mg group) • *Dose*: 25 mg • *Time point of administration*: 1 to 2 hours before induction of anaesthesia • *Route of administration*: oral • *Rescue antiemetics (if yes, which?)*: 42.7% (NA) Dolasetron (50 mg group) • *Dose*: 50 mg • *Time point of administration*: 1 to 2 hours before induction of anaesthesia • *Route of administration*: oral • *Rescue antiemetics (if yes, which?)*: 54.1% (NA) Dolasetron (100 mg group) • *Dose*: 100 mg • *Time point of administration*: 1 to 2 hours before induction of anaesthesia • *Route of administration*: oral • *Rescue antiemetics (if yes, which?)*: 39.2% (NA) Dolasetron (200 mg group) • *Dose*: 200 mg • *Time point of administration*: 1 to 2 hours before induction of anaesthesia • *Route of administration*: oral • *Rescue antiemetics (if yes, which?)*: 40.0% (NA)
Outcomes	*Complete response (no PONV) in 24 hours* • Outcome type: dichotomous outcome *Subjects with any SAE (0 to 24 hours)* • Outcome type: dichotomous outcome *Mortality (0 to 24 hours)* • Outcome type: dichotomous outcome

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Judgement comment: no information about the randomization method provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "double-blind" Judgement comment: insufficient information on blinding
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "total of 374 women were enrolled at 13 investigative sites. One genotypically female patient was undergoing abdominal hysterectomy as the final step in file process to become male and was legally male (but hormonally female) at the time of the study. This patient was included in the primary analysis of efficacy. Of the 374 study patients, one was excluded from the intent- to-treat efficacy analysis because surgery was cancelled after drug administration"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported

Notes	Two studies (1 non-randomized pilot study, 1 RCT)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "the second phase was a randomized, double-blind comparison of the efficacy of the three study antiemetics" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Quote: "all test agents were supplied to the administering anaesthetist in capped and coded syringes containing 2 ml of colourless liquid" Judgement comment: insufficient information on allocation concealment and time point of randomization
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "all test agents were supplied to the administering anaesthetist in capped and coded syringes containing 2 ml of colourless liquid"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "...hours postoperatively and at time of discharge from the day-stay unit (usually four to six hours post operation), by the attending nursing staff. Scores at 24 hours were attained by phone or standard questionnaire via return mail by the investigator"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Watts 1996 *(Continued)*

		Judgement comment: no information on blinding of outcome assessors
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "...166 making up the comparative trial population. Of the patients in the comparative trial, 54 were given metoclopramide (Group M), 59 received ondansetron (Group O) and 53 cyclizine (Group C)"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "...similar in the three groups for mean patient age, day of menstrual cycle and type of operation. Distribution of patients with a past history of motion sickness or previous PONV was comparable between groups and likewise there was no difference of significance in the distribution of operative procedures" Judgement comment: baseline characteristics (age): no; (weight, BMI, ASA): unclear. Potential effect modifiers (gender, history of PONV/motion sickness, perioperative opioids): no; (duration of anaesthesia, non-smoker): unclear

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Judgement comment: "patients were randomized in three groups by a computer generated list"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: "prophylactic anti-emetic drugs were given according to the randomization in a double-blind matter. all patients were given a 10 ml intravenous solution at the induction of anaesthesia". Insufficient information on blinding
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Judgement comment: quote: "there were no significant differences between our 3 groups with regard to age, type of surgery, body mass index (BMI), history of PONV, smoking status, use of N_2O or use of clonidine. Duration of anaesthesia was significantly longer in the methylprednisolone group in comparison with placebo. Significantly more sufentanil was used in the methylprednisolon group in comparison with placebo.Neither the use of sufentanil nor the duration of anaesthesia was significantly different between the two steroid groups" Baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, history of PONV): no; (history of motion sickness): unclear; (perioperative opioids, non-smoker, duration of anaesthesia): yes

Notes	Two studies. First as dose-finding study, and second with higher dose only (follow-up study)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "based on a computer-generated random number table"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the study medication consisted of either saline (control) or 0.625 or 1.25 mg droperidol, prepared in identical-appearing 2-ml syringes by an individual not involved in the study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "the electrocardiographic measurements were independently performed by two investigators who were unaware of which of the three treatment groups the patient had been assigned to. Heart rate was calculated..."
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported

White 2005-1 *(Continued)*

Other bias	High risk	Quote: "the three study groups were similar with respect to their demographic characteristics, durations of anesthesia, and total dosages of anesthetic and analgesic drugs, as well as intravenous fluid administration during the operation" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, perioperative opioids): no; (history of PONV/motion sickness, non-smoker): unclear; (duration of anaesthesia for study 1): yes

White 2005-2

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 2 groups, monoprophylaxis
Participants	**Baseline characteristics** Placebo • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 30 • *Received treatment (n)*: NA • *Analysed (n)*: 30 • *Age (mean ± SD, median (IQR), median (range))*: 47 ± 12 • *Weight (mean ± SD, median (IQR), median (range))*: 81 ± 18 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA • *Gender (female in %)*: NA • *Non-smoker (%)*: NA • *History of PONV/motion sickness (%)*: NA • *Type of general anaesthesia*: combined anaesthesia (desflurane, remifentanil) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 122 • *Use of perioperative opioids (if yes, which?)*: remifentanil (NA) • *Type of surgery*: ENT surgery (tympanoplasty, sinusotomy, septoplasty, other) Droperidol • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: 30 • *Received treatment (n)*: NA • *Analysed (n)*: 30 • *Age (mean ± SD, median (IQR), median (range))*: 46 ± 14 • *Weight (mean ± SD, median (IQR), median (range))*: 88 ± 24 • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA • *Gender (female in %)*: NA • *Non-smoker (%)*: NA • *History of PONV/motion sickness (%)*: NA • *Type of general anaesthesia*: combined anaesthesia (desflurane, remifentanil)

- *Weight (mean ± SD, median (IQR), median (range))*: 100 ± 36
- *BMI (mean ± SD, median (IQR), median (range))*: 37 ± 10
- *ASA I/II/III/IV (n)*: NA
- *Gender (female in %)*: 89.11
- *Non-smoker (%)*: 89
- *History of PONV/motion sickness (%)*: 15/12
- *Type of general anaesthesia*: inhalational anaesthesia (desflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 116
- *Use of perioperative opioids (if yes, which?)*: 236 µg fentanyl intraoperative, 76 µg fentanyl PACU, 1.7 mg hydromorphone PACU, 3 mg hydromorphone after PACU
- *Type of surgery*: cholecystectomy, laparoscopic tubal ligation, gastric bypass

Granisetron + dexamethasone

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 110
- *Received treatment (n)*: NA
- *Analysed (n)*: 104
- *Age (mean ± SD, median (IQR), median (range))*: 38 ± 13
- *Weight (mean ± SD, median (IQR), median (range))*: 104 ± 34
- *BMI (mean ± SD, median (IQR), median (range))*: 38 ± 11
- *ASA I/II/III/IV (n)*: NA
- *Gender (female in %)*: 87.5
- *Non-smoker (%)*: 85
- *History of PONV/motion sickness (%)*: 18/11
- *Type of general anaesthesia*: inhalational anaesthesia (desflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 122
- *Use of perioperative opioids (if yes, which?)*: 239 µg fentanyl intraoperative, 81 µg fentanyl PACU, 1.6 mg hydromorphone PACU, 4 mg hydromorphone after PACU
- *Type of surgery*: cholecystectomy, laparoscopic tubal ligation, gastric bypass

Included criteria: undergoing surgery procedure (e.g. cholecystectomy, laparoscopic tubal ligation, gastric bypass)

Excluded criteria: history of allergy to any of the potential study medications; pregnancy; breastfeeding; active menstruation; vomiting or retching within 24 hours before the operation; administration of antiemetic or psychoactive medication within 24 hours before surgery; history of severe (or unstable) cardiovascular, respiratory, metabolic, endocrine, or neurologic disease; active alcohol or drug abuse; impaired renal or hepatic function

Pretreatment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions	**Intervention characteristics** Ondansetron + dexamethasone • *Dose*:ondansetron 4 mg, dexamethasone 4 mg • *Time point of administration*: oral placebo 1 hour before surgery, dexamethasone after tracheal intubation, ondansetron at end of surgery • *Route of administration*: ondansetron IV, dexamethasone IV, placebo PO • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV Granisetron + dexamethasone

White 2006 *(Continued)*

		study medication, which were prepared by a research pharmacist at each hospital"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "a total of 220 patients were enrolled in the study. However, 15 patients (9 patients in the ondansetron group and 6 patients in the granisetron group) were excluded from the final data analysis because of protocol violations and/or incomplete data"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "demographic characteristics, including age, body weight, body mass index, smoking status, and history of PONV or motion sickness were comparable in both antiemetic treatment groups (Table 1). In addition, there were no differences in the durations of anesthesia and surgery or in the doses of preoperative medication, induction and maintenance anesthetics, muscle relaxant reversal drugs, and use of intraoperative (Table 1) and postoperative (Table 2) opioid analgesic medications in the ondansetron and granisetron groups" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "supplied by Ciba-Geigy (NZ) Ltd. Random number lists were used to assign patients to one of two treatment groups, and a sealed enveloped containing..."
Allocation concealment (selection bias)	Unclear risk	Quote: "a sealed enveloped containing the trial medication, either Scopoderm or a placebo patch, was allocated for each patient" Judgement comment: not stated; sequentially numbered, opaque, and sealed envelope (SNOSE)
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "identical, unlabelled patches containing either hyoscine or placebo were supplied by Ciba-Geigy (NZ) Ltd. Random number lists were used" Quote: "using a double-blind technique" Judgement comment: insufficient information on who was blinded
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "patients were carefully interviewed either personally or by telephone by a trained independent observer"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of the 221 patients entering the trial, 31 were subsequently excluded for the reasons outlined in Table 1"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "there were no demographic differences between the two treatment groups, each of 95 subjects, excepting that the hyoscine group contained more individuals with a past history of motion sickness (P < 0.05)" Judgement comment: baseline characteristics (ASA): no; (age, weight): unclear. Potential effect modifiers (history of PONV): no; (gender, duration of anaesthesia, non-smoker, perioperative opioids): unclear; (history of motion sickness): yes

Wilson 2001 *(Continued)*

Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the pharmacy supplied syringes in a blinded fashion with normal saline utilized as diluent such that all syringes have equal volumes. The medication was given by a blinded holding area or research nurse"
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	Judgement comment: insufficient information on missing outcome data (9% missing outcome data due to protocol violations, unclear which treatment arms, reasons not further described)
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender): no; (history of PONV/motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

Worni 2008

Study characteristics	
Methods	**Study design:** randomized controlled trial **Study grouping:** 3 groups, monoprophylaxis
Participants	**Baseline characteristics** Dexamethasone (group D) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: NA • *Received treatment (n)*: NA • *Analysed (n)*: 37 • *Age (mean ± SD, median (IQR), median (range))*: 52 (18 to 77) • *Weight (mean ± SD, median (IQR), median (range))*: NA • *BMI (mean ± SD, median (IQR), median (range))*: NA • *ASA I/II/III/IV (n)*: NA • *Gender (female in %)*: 81 • *Non-smoker (%)*: NA • *History of PONV/motion sickness (%)*: 0/NA • *Type of general anaesthesia*: inhalational anaesthesia (isoflurane or sevoflurane) • *Duration of anaesthesia or surgery (in min; as mean or median)*: 195 • *Use of perioperative opioids (if yes, which?)*: 5 µg/kg to 10 µg/kg fentanyl intraoperative, postoperative/per patient (9.7 mg) • *Type of surgery*: thyroid surgery Placebo (group C) • *Assessed for eligibility (n)*: - • *Enrolled (n)*: - • *Randomized (n)*: NA

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Worni 2008 *(Continued)*

- *Received treatment (n)*: NA
- *Analysed (n)*: 35
- *Age (mean ± SD, median (IQR), median (range))*: 51.5 (22 to 80)
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA
- *Gender (female in %)*: 66
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 0/NA
- *Type of general anaesthesia*: inhalational anaesthesia (isoflurane or sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 172
- *Use of perioperative opioids (if yes, which?)*: 5 µg/kg to 10 µg/kg fentanyl intraoperative, postoperative/per patient (17.9 mg)
- *Type of surgery*: thyroid surgery

Included criteria: undergoing thyroid surgery

Excluded criteria: had received antiemetic therapy within 48 hours before surgery; depression, chronic pain disorder, insulin-dependent diabetes mellitus; history of severe and/or repeated PONV (prolonged vomitus (first day postoperative) after previous minor surgery that led to change from standard anaesthetic protocol); pregnancy; younger than 18 years of age, had known malignant disease; had undergone previous thyroid or neck surgery. In this per-protocol analysis, patients who received extended resection because of positive findings in the fresh frozen tissue analysis and those who did not receive standard anaesthesia were also excluded. Patients with preoperative voice disturbance or a voice visual analog scale (VVAS) = 40 were not eligible

Pretreatment: baseline characteristics (age): no; (weight, ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, history of PONV): no; (history of motion sickness, non-smoker): unclear; (perioperative opioids -> There is a significant difference between dexamethasone and control group in terms of opioid consumption (only at 48 hours)): yes

Interventions	**Intervention characteristics** Dexamethasone (group D) • *Dose*: 8 mg • *Time point of administration*: infusions were given over 15 minutes, 45 minutes before initiation of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg (first line), 0.625 mg droperidol (second line) Placebo (group C) • *Dose*: 2 mL 0.9% NaCl • *Time point of administration*: infusions were given over 15 minutes, 45 minutes before initiation of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: ondansetron 4 mg (first line), 0.625 mg droperidol (second line)
Outcomes	*Postoperative wound infection (30 days after the intervention)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 48 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** NA

Study's primary outcome: nausea

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "randomization was achieved with a computerized random number table with a repetition cycle of 25"
Allocation concealment (selection bias)	Low risk	Quote: "the randomization code was kept separate and was unknown to any of the investigators until after the study was finished"
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "...postoperative nausea and vomiting. The treatment and control solutions were prepared off the ward, appeared transparent, and were marked identically. The infusions were given over 15 minutes by a blinded nursing staff, 45 minutes before the initiation of anesthesia. Thus, the patient, the nurse, the anesthesiologist, the surgeon, and the data analyst were all blinded..."
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "...before the initiation of anesthesia. Thus, the patient, the nurse, the anesthesiologist, the surgeon, and the data analyst were all blinded"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "of these, ninety patients consented to participate in the study. Exclusion criteria were: depression, chronic pain disorder, insulin-dependent diabetes mellitus (n 7), history of severe and/or repeated PONV (n 2), pregnancy, age 18 years (n 0), preoperatively known malignant disease (n 23), previous thyroid or neck surgery (n 11), and no consent (n 15 denied; n 9 not consented because of absence of investigators or reasons unknown). Eighteen patients were excluded because of intraoperative detected malignancy and additional lymphadenectomy (n 10) or because of protocol violations: n 3 did not receive timely dexamethasone, n 3 received additional steroids intraoperatively, and n 2 received postoperative analgesic/antiemetic regimens that did not follow the protocol" Judgement comment: all missing outcome (18/90 exclusions due to protocol violations = 20%) data were described. Reasons were not related to the outcome of interest
Selective reporting (reporting bias)	Unclear risk	Judgement comment: NCT00619086 (retrospective registration)

	Study's primary outcome: incidence of PONV **Trial registry number:** NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "upon consent, each patient was randomized to one of four intravenous treatment categories" Judgement comment: no further information on sequence generation provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "in this way, the anesthesiologist, study investigator, patient, operating room attendants, and recovery room nurses, were all blinded to the identity of the prophylactic treatment" Quote: "each of these therapy medications was prepared by either the operating room pharmacist (not otherwise involved in the study) or by the research coordinator, and presented to the attending anesthesiologist"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "in this way, the anesthesiologist, study investigator, patient, operating room attendants, and recovery room nurses, were all blinded to the identity of the prophylactic treatment"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "there were eight study patients (two from the placebo group, three from the ondansetron group, two from the droperidol group, and one from the combination group) excluded from the study because they were inadvertently given thiopentol for induction of anesthesia. Thiopentol has been known to cause post-operative nausea and vomiting. 2 0 Three study patients (one in the droperidol group, one in the ondansetron group, and one in the combination group) were admitted due to surgical complications unrelated to the study"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "no differences in demographic data among the four treatment groups in regards to age, height, weight, history of PONV after previous general anesthesia, duration of anesthesia, and history of motion sickness were found (Table I). There were also no differences among study groups in administration of midazolam, opioids given intraoperatively and post- operatively, all known to have anti-emetic or emetic properties. However, the combination group did receive more nitrous oxide 70% than the other groups (Table II) which may lead to increased PONV" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, history of PONV, perioperative opioids): no; (non-smoker): unclear; (history of motion sickness): yes

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 48
- *Received treatment (n)*: NA
- *Analysed (n)*: 43
- *Age (mean ± SD, median (IQR), median (range))*: 46.0 ± 11.1
- *Weight (mean ± SD, median (IQR), median (range))*: NA
- *BMI (mean ± SD, median (IQR), median (range))*: 24.6 ± 3.2
- *ASA I/II/III/IV (n)*: 34/9/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 100
- *History of PONV/motion sickness (%)*: NA
- *Type of general anaesthesia*: balanced anaesthesia (sevoflurane, remifentanil)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 124.9
- *Use of perioperative opioids (if yes, which?)*: intraoperative remifentanil, 9 patients received postoperative fentanyl
- *Type of surgery*: primary thyroidectomy

Included criteria: adult female between 20 and 65 years of age, ASA, I or II, scheduled for primary thyroidectomy under general anaesthesia with endotracheal intubation and immediate postoperative extubation

Excluded criteria: known tracheal pathology; tracheostomy; previous head and neck surgery; recent upper respiratory tract infection within 6 weeks; body mass index > 35 kg/m^2; inflammation or haemorrhage in the upper gastrointestinal tract; use of non-steroidal anti-inflammatory drug or steroid medication within 24 hours; allergy to general anaesthetic used in this study; known or suspected difficult airway; expected duration of surgery exceeding 180 minutes; underwent reoperation during the first 24 hours postoperatively

Pretreatment: baseline characteristics (age, BMI, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker): no; (history of PONV/motion sickness, perioperative opioids): unclear

Interventions	**Intervention characteristics** Placebo (group C) • *Dose*: 2 × saline • *Time point of administration*: injections at 5 minutes before induction of anaesthesia and 10 minutes before end of surgery • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: NA Dexamethasone (group D) • *Dose*: 10 mg dexamethasone • *Time point of administration*: at 5 minutes before induction of anaesthesia, saline 10 minutes before end of surgery • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: NA
Outcomes	*Vomiting (6 to 24 hours)* • Outcome type: dichotomous outcome *Headache (0 to 24 hours)* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)*

Identification	**Sponsorship source:** NA **Country:** Korea **Setting:** inpatient, single-centre **Author's name:** Sung Mee Jung **Institution:** Yeungnam University School of Medicine, Daegu, Korea **Email:** applejsm@gmail.com **Address:** Department of Anesthesiology and Pain Medicine, Yeungnam University School of Medicine, 170, Hyeonchung-ro, Nam-gu, Daegu 42415, Korea **Duration of study:** October 2013 to October 2015 **Language:** English **Study's primary outcome:** incidence of postoperative sore throat (POST) at 6 hours after extubation **Trial registry number:** NCT02039427
Notes	Two out of 4 groups relevant (ketorolac)

Risk of bias

Bias	**Authors' judgement**	**Support for judgement**
Random sequence generation (selection bias)	Low risk	Quote: "using a computer-generated random assignment scheme"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "each study drug was made at the same volume (2 ml) by a nurse blinded to group assignment on the morning of surgery"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "at 1, 6 and 24 hours after extubation, the incidences and severities of sore throat, hoarseness and pain were assessed by an independent investigator unaware of group assignments"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "one hundred and ninety-two female patients who underwent thyroidectomy from October 2013 to October 2015 were consecutively enrolled in this study (Fig. 1). After randomized allocation, 12 patients were excluded because of steroid medication (one), anaphylactic reaction to antibiotic resulting in unexpected cancellation of surgery (one) and longer duration of surgery (two), withdrawal of the consent (one), and loss of follow-up (seven). Therefore, a total of 180 patients were included in the final analysis"
Selective reporting (reporting bias)	High risk	Judgement comment: NCT02039427 (prospective registration). Timing of assessment for the primary outcome (postoperative sore throat) was different between protocol and study report. The primary outcome was not PONV-related
Other bias	Unclear risk	Quote: "demographic, intubation and surgical characteristics were comparable among groups (Table 1)"

Trial registry number: NA

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Judgement comment: quote: "patients were randomly assigned to receive intravenous ramosetron 0.3 mg intravenously on the end of the procedure and 0.075 mg palonosetron intravenously immediately after induction of anesthesia using random allocation software (version 2.0)" (translated)
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	High risk	Judgement comment: different time points of administration. We assume that anaesthesiologists were not blinded
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Judgement comment: no statement
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	Judgement comment: in total, 290 (145/145) participants were enrolled and 262 (132/130) were included in the analysis. Reasons for missing outcome data were not described
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Low risk	Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Baseline characteristics

Tropisetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 76
- *Received treatment (n)*: 76
- *Analysed (n)*: 76
- *Age (mean ± SD, median (IQR), median (range))*: 52.3 ± 13.4
- *Weight (mean ± SD, median (IQR), median (range))*: 63.2 ± 11.3
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 88.2
- *History of PONV/motion sickness (%)*: 0
- *Type of general anaesthesia*: TIVA
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 170.5
- *Use of perioperative opioids (if yes, which?)*: 324.3 µg fentanyl intraoperative, 7.2 mg postoperative morphine IM
- *Type of surgery*: modified radical mastectomy

Dexamethasone + tropisetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 73
- *Received treatment (n)*: 73
- *Analysed (n)*: 73
- *Age (mean ± SD, median (IQR), median (range))*: 51.0 ± 14.5
- *Weight (mean ± SD, median (IQR), median (range))*: 64.7 ± 13.2
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 100
- *Non-smoker (%)*: 86.3
- *History of PONV/motion sickness (%)*: 0
- *Type of general anaesthesia*: TIVA
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 183.6
- *Use of perioperative opioids (if yes, which?)*: 315.7 µg fentanyl intraoperative, 5.8 mg postoperative morphine IM
- *Type of surgery*: modified radical mastectomy

Methylprednisolone + tropisetron

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 75
- *Received treatment (n)*: 75
- *Analysed (n)*: 75
- *Age (mean ± SD, median (IQR), median (range))*: 54.1 ± 12.2
- *Weight (mean ± SD, median (IQR), median (range))*: 64.3 ± 10.5

Study's primary outcome: incidence of PONV

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "all patients were randomly assigned using randomization table to one of the 3 groups"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "the skin was sutured. The study drugs were prepared and given intravenously in equal volumes of 5 ml by a nursing staff not involved in either anesthesia or data collection"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "staff and a ward nursing staff, who were blinded to the drug administered, recorded the occurrence of PONV, the request and time of rescue antiemetic medication at 24, 48 and 72 hours postoperatively"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "...was statistically similar among 3 groups. There was no significant difference among groups with respect to intraoperative fluid requirement and total dose of fentanyl. The requirement of morphine given intramuscularly for postoperative analgesia was relative higher in group T compared with group TD and group TM, but the difference was not significant (P>0.05; Table I)" Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness): no; (perioperative opioids): yes

Zarate 2000 *(Continued)*

- *Assessed for eligibility (n)*: -
- *Enrolled (n)*: -
- *Randomized (n)*: 50
- *Received treatment (n)*: 50
- *Analysed (n)*: 50
- *Age (mean ± SD, median (IQR), median (range))*: 46 ± 15
- *Weight (mean ± SD, median (IQR), median (range))*: 80 ± 18
- *BMI (mean ± SD, median (IQR), median (range))*: NA
- *ASA I/II/III/IV (n)*: NA/NA/0/0
- *Gender (female in %)*: 40
- *Non-smoker (%)*: NA
- *History of PONV/motion sickness (%)*: 28/18
- *Type of general anaesthesia*: inhalational anaesthesia (sevoflurane)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 93
- *Use of perioperative opioids (if yes, which?)*: 1065 µg fentanyl intraoperative, 96 µg fentanyl in PACU
- *Type of surgery*: ENT procedure

Included criteria: ASA I and II, outpatient, 20 to 75 years of age, undergoing otolaryngological (ENT) procedures

Excluded criteria: had received any antiemetic medication within 24 hours before operation; pregnant; had clinically significant cardiovascular, neurological, renal, hepatic, gastrointestinal, or endocrinologic disease; history of drug abuse; > 100% above ideal body weight

Pretreatment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (non-smoker): unclear; (perioperative opioids): yes

Interventions

Intervention characteristics

Dolasetron (12.5 mg group)

- *Dose*: 12.5 mg
- *Time point of administration*: within a 30 minute interval before end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 30% (promethazine 6.25 mg, droperidol 1.25 mg, ondansetron)

Dolasetron (25 mg group)

- *Dose*: 25 mg
- *Time point of administration*: within a 30 minute interval before end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 25.5% (promethazine 6.25 mg, droperidol 1.25 mg, ondansetron)

Ondansetron (4 mg group)

- *Dose*: 4 mg
- *Time point of administration*: within a 30 minute interval before end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 22.4% (promethazine 6.25 mg, droperidol 1.25 mg, ondansetron)

Ondansetron (8 mg group)

- *Dose*: 8 mg
- *Time point of administration*: within a 30 minute interval before end of surgery
- *Route of administration*: IV
- *Rescue antiemetics (if yes, which?)*: 30% (promethazine 6.25 mg, droperidol 1.25 mg, ondansetron)

Outcomes	*Vomiting (0 to 24 hours)* • Outcome type: dichotomous outcome *Vomiting (in-hospital symptoms)* • Outcome type: dichotomous outcome *Vomiting (post discharge to 24 hours)* • Outcome type: dichotomous outcome *Nausea (0 to 24 hours)* • Outcome type: dichotomous outcome *Complete response (no PONV) in 24 hours* • Outcome type: dichotomous outcome *Adverse events (general notes in the publication, 24 hours' observation)* • Outcome type: general notes on side effects
Identification	**Sponsorship source:** NA **Country:** USA **Setting:** outpatient, single-centre **Author's name:** Paul F. White **Institution:** Department of Anesthesiology and Pain Management, University of Texas Southwestern Medical Center at Dallas, Dallas, Texas, USA **Email:** pwhite@mednet.swmed.edu **Address:** Department of Anesthesiology and Pain Management, University of Texas Southwestern Medical Center at Dallas, 5161 Harry Hines Blvd., CS2.126, Dallas, TX 75235-9068, USA **Language:** English **Duration of study:** NA **Trial registry number:** NA **Study's primary outcome:** total costs for managing PONV
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "according to a computer-generated random number schedule"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "the study drug was prepared by the OR pharmacist according to a computer-generated random number schedule, diluted to a total volume of 5 mL and administered within a 30-min interval before the end of surgery"

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Zarate 2000 *(Continued)*

		Judgement comment: no further information on blinding of anaesthetists and participants
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "a trained interviewer who was 'blinded' to the group assignment contacted all patients by telephone 24 h after discharge from the hospital to inquire about postdischarge side effects and the need for any therapeutic interventions at home"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Judgement comment: no missing outcome data
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	High risk	Quote: "there were no significant differences among the four treatment groups with respect to demographic data, including age, weight, sex, type and duration of surgery, incidence of motion sickness, or previous PONV (Table 2). In the female patients, there were no differences in the number of days from the start of their last menstrual cycle. The doses of anesthetic drugs including propofol, opioids, muscle relaxants (and their antagonists), steroids, and volume of perioperative IV fluid, did not differ among the four groups. There were also no significant differences in the times to eye opening, tracheal extubation, response to verbal commands, and orientation, the time to achieving discharge readiness criteria or the time to actual discharge among the four groups (Table 3). After discharge..." Judgement comment: baseline characteristics (age, weight, ASA): no. Potential effect modifiers (gender, duration of anaesthesia, history of PONV/motion sickness): no; (non-smoker): unclear; (perioperative opioids): yes

	Trial registry number: NA
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "patients were allocated to three groups equally (40 patients in each group) with the random numbers generated using the Rand function of Excel 2003 (Microsoft, Redmond, WA, USA)"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Judgement comment: no statement
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "on complete recovery, patients were transferred to the gynecological ward and, to assess nausea and vomiting, they were visited at 2, 6, 12, and 24 h after the surgery by a nurse anesthetist who was unaware of the drugs involved in the study"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "all patients (40 in each treatment group) enrolled in the study recovered from anesthesia after surgery" Judgement comment: 5 participants were excluded for prolonged surgery and 5 participants were added
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Quote: "the characteristics of the patients and the durations of surgery and anesthesia are shown in Table 1. There were no significant differences in these characteristics among the three groups" Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker): no; (history of PONV/motion sickness, perioperative opioids): unclear

Zhou 2012 *(Continued)*

- *BMI (mean ± SD, median (IQR), median (range))*: 22.9 ± 2.6
- *ASA I/II/III/IV (n)*: NA
- *Gender (female in %)*: 76
- *Non-smoker (%)*: 84
- *History of PONV/motion sickness (%)*: 20
- *Type of general anaesthesia*: balanced anaesthesia (sevoflurane, fentanyl)
- *Duration of anaesthesia or surgery (in min; as mean or median)*: 78.7
- *Use of perioperative opioids (if yes, which?)*: 162.8 µg fentanyl intraoperative
- *Type of surgery*: thyroid surgery

Included criteria: undergoing thyroid surgery

Excluded criteria: had received antiemetic therapy within 48 hours before surgery; depression, chronic pain disorder, gastrointestinal disease, or insulin-dependent diabetes mellitus; pregnant or 18 years of age; had known malignant disease; had undergone previous thyroid or neck surgery; underwent extended lymphadenectomy because of positive findings in fresh frozen tissue analysis; not given standard anaesthesia and postoperative management

Pretreatment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Interventions	**Intervention characteristics** Dexamethasone (group D) • *Dose*: 8 mg • *Time point of administration*: immediately before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV, tropisetron 5 mg IV, if symptoms persisted Tropisetron (group T) • *Dose*: 5 mg • *Time point of administration*: immediately before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV, tropisetron 5 mg IV, if symptoms persisted Dexamethasone + tropisetron (group DT) • *Dose*: dexamethasone 8 mg, tropisetron 5 mg • *Time point of administration*: immediately before induction of anaesthesia • *Route of administration*: IV • *Rescue antiemetics (if yes, which?)*: metoclopramide 10 mg IV, tropisetron 5 mg IV, if symptoms persisted
Outcomes	*Vomiting (0 to 6 hours)* • Outcome type: dichotomous outcome *Subjects with any AE (time point unknown)* • Outcome type: dichotomous outcome *Postoperative wound infection (0 to 30 days)* • Outcome type: dichotomous outcome *Headache (time point unknown)*

- Outcome type: dichotomous outcome

Adverse events (general notes in the publication, 24 hours' observation)

- Outcome type: general notes on side effects

Identification	**Sponsorship source:** NA **Country:** China **Setting:** inpatient, single-centre **Author's name:** Zhiqian Hu **Institution:** Department of General Surgery, Changzheng Hospital, Second Military Medical University, Shanghai, China **Email:** czhuzq@yahoo.com.cn **Address:** Department of General Surgery, Changzheng Hospital, Second Military Medical University, No. 415 Fengyang Road, Shanghai 200003, People's Republic of China **Duration of study:** October 2009 to March 2010 **Language:** English **Study's primary outcome:** nausea, vomiting, and pain **Trial registry number:** ChiCTR-TRC-09000558
Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote: "a randomization list was prepared by a random number function of a computer spreadsheet"
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Low risk	Quote: "and identical syringes containing each drug were prepared by personnel not involved in the study"
Blinding of outcome assessment (detection bias) All outcomes	Low risk	Quote: "for all patients, the same two investigators, who were blinded as to the group allocation, assessed the patients for nausea, vomiting, and pain"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "October 2009 and March 2010, a total of 246 patients underwent thyroidectomy at our institution. Among them, 168 patients consented to participate in the study. In all, 18 patients were excluded because a malignancy was detected intraoperatively and additional lymphadenectomy was required or because of protocol violations: 12 patients had a malignancy and underwent additional lymphadenectomy, four received additional steroids intraoperatively, and two received postoperative analgesic regimens that did not follow the protocol. Data from 150 patients..."
Selective reporting (reporting bias)	High risk	Judgement comment: ChiCTR-TRC-09000558 (prospective registration). The prospectively registered primary outcome in the protocol was described as

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Zhou 2012 *(Continued)*

		"nausea and vomiting 2, 4, 8, 16, 24, 36, 48, 72 h" and was changed into "nausea, vomiting and pain". Pain was introduced newly to the final study report. The time point "72h" as described in the protocol was omitted from the final study. Other time points were merged into "0–6 h after the operation and 6–48 h postoperatively"
Other bias	Unclear risk	Quote: "patient characteristics and operative data are summarized in Table 1. Treatment groups were similar with respect to patient characteristics and the operative and anesthesia management" Judgement comment: baseline characteristics (age, BMI): no; (ASA): unclear. Potential effect modifiers (gender, duration of anaesthesia, non-smoker, history of PONV/motion sickness, perioperative opioids): no

Notes	None

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote: "antiemetic treatment was randomized" Judgement comment: insufficient information on randomization provided
Allocation concealment (selection bias)	Unclear risk	Judgement comment: no statement
Blinding of participants and personnel (performance bias) All outcomes	Unclear risk	Quote: "double-blind" Judgement comment: insufficient information on blinding
Blinding of outcome assessment (detection bias) All outcomes	Unclear risk	Quote: "information on postoperative nausea and vomiting over the 24-h period after administration of the study medication was obtained from three sources: nursing observation in the recovery room and on the ward; the attending anaesthetist interviewed the patient on the day after the operation and completed a checklist; the patient completed a VAS score for self-assessment of nausea and vomiting and well-being on the day after surgery"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Quote: "we studied 70 patients; one patient given placebo was excluded because of missing data. The results are presented for 35 patients who received tropisetron and 34 who received placebo"
Selective reporting (reporting bias)	Unclear risk	Judgement comment: no reference to a study protocol or trial registry number reported
Other bias	Unclear risk	Judgement comment: baseline characteristics (age, weight): no; (ASA): unclear. Potential effect modifiers (gender, history of PONV): no; (history of motion sickness, duration of anaesthesia, non-smoker, perioperative opioids): unclear

Abbreviations: AE = adverse event; ASA = American Society of Anesthesiologists physical status classification system; BMI = body mass index; CABG = coronary artery bypass graft; ICU = intensive care unit; IM = intramuscular; IQR = interquartile range; IV = intravenous; n = number of participants; NA = not available; NSAIDs = non-steroidal anti-inflammatory drugs; PACU = post-anaesthesia care unit; PCA = patient-controlled analgesia; PO = per oral; PONV = postoperative nausea and vomiting; SD = standard deviation; SNOSE = sequentially numbered opaque sealed envelopes; TIVA = total intravenous anaesthesia.

Abbreviations: PONV = postoperative nausea and vomiting.

Characteristics of studies awaiting classification *[ordered by study ID]*

Abdel Halim 2009

Methods	Randomized controlled trial
Participants	Patients undergoing unilateral modified radical mastectomy
Interventions	Preoperative administration of oral gabapentin 800 mg, IV dexamethasone 16 mg, both drugs together or no treatment
Outcomes	Pain, preoperative anxiety, haemodynamic response to intubation, opioid consumption
Notes	No full text available

Abusalem 2011

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy
Interventions	Dexamethasone 16 mg 2 hours before surgery
Outcomes	PONV, pain
Notes	Mail sent on 18th of January 2018; reasons for request were missing information about mean age with standard deviation or range of participants and type of anaesthesia regimen, no response received

ACTRN12615000540516

Methods	Randomized controlled trial
Participants	Patients who are presenting to preadmission clinic for single joint hip or knee arthroplasty; age > 18
Interventions	Dexamethasone (8 mg) first dose given immediately preoperatively and second dose given 24 hours post surgery or placebo
Outcomes	PONV, pain
Notes	Study status (completed), first posted (2015), missing information (anaesthesia regimen, outcomes)

Aleyasin 2014

Methods	Randomized controlled trial
Participants	Female patients undergoing myomectomy and hysterectomy surgeries

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Aleyasin 2014 *(Continued)*

Interventions	Granisetron 40 µg/kg or metoclopramide 0.2 mg/kg at end of surgery
Outcomes	PONV, patient satisfaction, sedation
Notes	Mail sent on 19th of March 2018 and again on 31st of July 2018; reason for request was missing information about type of anaesthesia regimen; no response received

Almustafa 2020

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic sleeve gastrectomy
Interventions	Dexamethasone 8 mg (nebulized) 1 hour before surgery and control (S) with saline nebulizer
Outcomes	Postoperative sore throat, nausea and vomiting
Notes	Study identified in search update; data will be included in next update of the review

Aydin 2019

Methods	Randomized controlled trial
Participants	Patients undergoing middle ear surgery
Interventions	0.075 mg palonosetron, 5 mg tropisetron, and 8 mg ondansetron were administered intravenously and compared
Outcomes	Pain, nausea, vomiting, headache, constipation
Notes	Study identified in search update; data will be included in next update of the review

Aziz 2011

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy, ASA I and II, 15 to 50 years of age
Interventions	Metoclopramide 10 mg IV or dexamethasone 8 mg IV at time of induction
Outcomes	PONV
Notes	Mail sent on 19th of March 2018; reason for request was missing information on age of participants; mail could not be delivered

Bilgen 2018

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Bilgen 2018 *(Continued)*

Participants	Patients undergoing laparoscopic gynaecological surgery or laparoscopic cholecystectomy, 18 to 60 years old, ASA I or II
Interventions	Aprepitant (40 mg) orally 1 to 2 hours before induction of anaesthesia and 2 mL saline intravenously (IV) within the last 30 minutes of surgery or oral placebo identical to aprepitant 1 to 2 hours before induction of anaesthesia and ondansetron (4 mg) IV within the last 30 minutes of surgery; all patients received dexamethasone (8 mg) IV after induction
Outcomes	PONV
Notes	Study identified after first search; data will be included in next update of the review

Biswas 2003a

Methods	Randomized controlled trial
Participants	Female patients undergoing laparoscopic tubal ligation, ASA I and II
Interventions	Ondansetron 4 mg IV or dexamethasone 8 mg IV or ondansetron 4 mg IV with dexamethasone 8 mg IV immediately before induction
Outcomes	PONV
Notes	Missing information about range of age; no contact details available

Blowey 2002

Methods	Randomized controlled trial
Participants	NA
Interventions	Metoclopramide or P6 acupressure
Outcomes	PONV
Notes	No full text available

Campbell 1990

Methods	Randomized controlled trial
Participants	Patients undergoing knee arthroscopy, laparoscopy, or dental extraction, ASA I or II, 18 to 59 years of age
Interventions	Droperidol 0.015 mg/kg IV or no treatment immediately after intubation
Outcomes	PONV, time to awakening, time to orientation
Notes	Missing information about study group sizes; no contact details available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Carrascosa 1997

Methods	Randomized controlled trial
Participants	Patients undergoing maxillofacial surgery
Interventions	NA
Outcomes	NA
Notes	No full text available

Ceyhan 2004

Methods	Randomized controlled trial
Participants	Patients undergoing major orthopaedic surgery, 18 to 70 years of age
Interventions	Metoclopramide 10 mg IV 3 times a day or Reliefband to P6 acupuncture point or placebo and inactive Reliefband
Outcomes	PONV
Notes	No full text available

Champion 2018

Methods	Randomized controlled trial
Participants	Patients with planned non-emergent cardiac surgery
Interventions	4 mg betamethasone with/without 0.625 mg droperidol compared to control; control group was treated as per routine hospital practices
Outcomes	PONV, `drug-related` side effects
Notes	Study identified in search update; data will be included in next update of the review

Chan 1983

Methods	Randomized controlled trial
Participants	Female patients undergoing suction evacuation for termination of pregnancy
Interventions	Metoclopramide 10 mg IV at time of suction or prochlorperazine 6.25 mg IM with premedication or prochlorperazine 12.5 mg IM with premedication or no treatment
Outcomes	Vomiting
Notes	Missing information about range of age; no contact details available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Charton 2018

Methods	Randomized controlled trial
Participants	Patients scheduled to undergo minor gynaecological, abdominal, or orthopaedic surgery under general anaesthesia for ambulatory surgery, 18 to 65 years of age, ≥ 2 Apfel risk factors
Interventions	Droperidol (0.625 or 1.25 mg) or ondansetron 4 mg
Outcomes	Akathisia, PONV
Notes	Study identified after the first search; data will be included in next update of the review

Chatterjee 2017

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy
Interventions	Dexamethasone 8 mg, palonosetron 0.075 mg, or dexamethasone 8 mg plus palonosetron 0.075 mg
Outcomes	PONV, need for rescue antiemetic
Notes	Study identified in search update; data will be included in next update of the review

Chen 2002

Methods	Randomized controlled trial
Participants	Patients undergoing gynaecological surgery
Interventions	Ondansetron and droperidol
Outcomes	PONV
Notes	No full text available

ChiCTR-TRC-09000671

Methods	Randomized controlled trial
Participants	Patients undergoing open gynaecological surgery, 18 to 60 years of age, ASA I and II
Interventions	Aprepitant or placebo
Outcomes	Complete response
Notes	Study status (completed), first posted (2005), missing information (anaesthesia regimen, time point of administration)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

ChiCTR-TRC-09000672

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic gynaecological surgery, 18 to 60 years of age, ASA I and II
Interventions	Cetirizine 1 hour preoperatively or dexamethasone and placebo
Outcomes	Complete response
Notes	Study status (completed), first posted (2005), missing information (anaesthesia regimen)

ChiCTR-TRC-09000739

Methods	Randomized controlled trial
Participants	Patients undergoing open gynaecological surgery, 18 to 65 years of age
Interventions	Aprepitant immediately before induction of anaesthesia or dexamethasone and aprepitant immediately before induction of anaesthesia
Outcomes	Complete response, pain, nausea
Notes	Study status (completed), first posted (2009), missing information (anaesthesia regimen)

Cho 2019

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic gynaecological surgery
Interventions	Ramosetron 0.3 mg, 0.45 mg, or 0.6 mg at end of surgery
Outcomes	Nausea severity, pain scores, adverse events, patient satisfaction
Notes	Study identified in search update; data will be included in next update of the review

Cooke 1979

Methods	Randomized controlled trial
Participants	Female patients between menarche and menopause undergoing caesarean section or non-obstetrical uterine dilatation and curettage or uterine evacuation
Interventions	Domperidone 4 mg or metoclopramide 10 mg or placebo
Outcomes	PONV, dizziness, drowsiness
Notes	Missing information about range of age; no contact details available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Cosar 1997

Methods	Randomized controlled trial
Participants	Female adult patients undergoing major gynaecological surgery, ASA I and II
Interventions	Tropisetron 5 mg IV or placebo IV 15 minutes before end of surgery
Outcomes	PONV
Notes	Missing information about randomisation; no contact details available

CTRI/2012/05/002668

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy, ASA I and II, weight between 30 and 75 kg
Interventions	Metoclopramide (10 mg) and dexamethasone (5 mg) before operation or metoclopramide (10 mg) and dexamethasone (2.5 mg) before operation or metoclopramide (10 mg) and saline before operation
Outcomes	PONV
Notes	Study status (recruiting), first posted (2012), missing information (age, anaesthesia regimen)

CTRI/2013/03/003507

Methods	Randomized controlled trial
Participants	Participants over 18 years of age undergoing elective middle ear and nasal surgeries
Interventions	Oral and intravenous ondansetron administered at end of surgery
Outcomes	PONV, pruritus
Notes	Study status (recruiting), first posted (2013), missing information (anaesthesia regimen)

CTRI/2013/04/003570

Methods	Randomized controlled trial
Participants	Patients given elective general anaesthesia, 21 to 50 years of age
Interventions	Granisetron (1 mg/mL) 1 minute before induction of anaesthesia or metoclopramide (5 mg/mL) 1 minute before induction of anaesthesia
Outcomes	Pain, PONV
Notes	Study status (recruiting), first posted (2013), missing information (anaesthesia regimen)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

CTRI/2013/05/003630

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy, ASA I and II
Interventions	Palonosetron (0.075 mg) just before induction of anaesthesia or dexamethasone (8 mg) just before induction of anaesthesia or palonosetron (0.075 mg) and dexamethasone (8 mg) just before induction of anaesthesia
Outcomes	PONV
Notes	Study status (completed), first posted (2013), missing information (age, anaesthesia regimen)

CTRI/2014/11/005214

Methods	Randomized controlled trial
Participants	Patients scheduled for laparoscopic gynaecological surgery, 19 to 60 years of age, female, ASA I and II
Interventions	Palonosetron (0.15 mg), palonosetron (0.075 mg), palonosetron (0.075 mg) with dexamethasone (8 mg), and ondansetron (4 mg) administered intravenously before induction of anaesthesia
Outcomes	Nausea and vomiting at 6, 24, and 72 hours postoperatively
Notes	Study status (recruiting), first posted (2014), missing information (anaesthesia regimen)

CTRI/2014/12/005333

Methods	Randomized controlled trial
Participants	Patients scheduled for elective surgery, older than 18 years of age, breast cancer, ASA I to III
Interventions	Aprepitant (80 mg) 3 hours before induction of anaesthesia or dexamethasone (8 mg) at time of induction of anaesthesia
Outcomes	PONV, adverse reaction
Notes	Study status (completed), first posted (2014), missing information (anaesthesia regimen)

CTRI/2015/03/005616

Methods	Randomized controlled trial
Participants	Patients scheduled for elective intracranial surgery, ASA I and II, GCS 15
Interventions	Ondansetron (4 mg) given at the time of dural closure or palonosetron (0.075 mg) given at the time of dural closure

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

CTRI/2015/03/005616 *(Continued)*

Outcomes	PONV, side effects
Notes	Study status (recruiting), first posted (2015), missing information (age, anaesthesia regimen, intervention)

CTRI/2015/09/006223

Methods	Randomized controlled trial
Participants	Patients undergoing open ovarian cancer surgery and requiring opioid-based PCA, 18 to 70 years of age, ASA I and II
Interventions	Palonosetron (0.075 mg) and dexamethasone (4 mg) given at time of wound closure; thereafter placebo drug will be given 3 times a day for 48 hours; or ondansetron (8 mg) and dexamethasone (4 mg) given at time of wound closure; thereafter, ondansetron 4 mg will be given 3 times a day for 48 hours
Outcomes	PONV, pain, adverse events
Notes	Study status (completed), first posted (2015), missing information (anaesthesia regimen, outcome details)

CTRI/2016/07/007108

Methods	Randomized controlled trial
Participants	Patients undergoing elective laparoscopic surgery under general anaesthesia, ASA I and II, 18 to 60 years of age
Interventions	Palonosetron (0.075 mg) or dexamethasone (8 mg) or palonosetron (0.075 mg) and dexamethasone (8 mg)
Outcomes	PONV, pain
Notes	Study status (closed), first posted (2016), missing information (anaesthesia regimen, time point of administration)

CTRI/2016/08/007195

Methods	Randomized controlled trial
Participants	Patients planned for laparoscopic sleeve gastrectomy, ASA I to III, BMI > 32.5 kg/m^2
Interventions	Palonosetron (1 mcg) 30 minutes before induction of anaesthesia and dexamethasone or ondansetron (0.1 mg/kg) and dexamethasone
Outcomes	PONV
Notes	Study status (completed), first posted (2016), missing information (anaesthesia regimen, age, time point of administration)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

CTRI/2017/03/007998

Methods	Randomized controlled trial
Participants	Patients undergoing middle ear surgery, ASA I and II, non-hypertensive and non-diabetic
Interventions	Ondansetron (8 mg) and dexamethasone (8 mg) before induction of anaesthesia or palonosetron (0.075 mg) and dexamethasone (8 mg) before induction of anaesthesia
Outcomes	PONV
Notes	Study status (recruiting), first posted (2017), missing information (anaesthesia regimen)

CTRI/2017/06/008769

Methods	Randomized controlled trial
Participants	Patients scheduled for elective laparoscopic cholecystectomy under general anaesthesia, ASA I and II, 18 to 60 years of age, BMI < 30 kg/m^2
Interventions	Dexamethasone (2 mg) after induction of anaesthesia or dexamethasone (4 mg) after induction of anaesthesia or saline (1 mL) after induction of anaesthesia
Outcomes	PONV
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen)

CTRI/2017/08/009295

Methods	Randomized controlled trial
Participants	Patients scheduled for laparoscopic cholecystectomy
Interventions	Palonosetron (0.075 mg) 3 minutes before induction of anaesthesia or ondansetron (8 mg) 3 minutes before induction of anaesthesia
Outcomes	PONV, side effects
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen, age)

Dag 2020

Methods	Randomized controlled trial
Participants	Female patients between 19 and 70 years of age who were admitted for laparoscopic abdominal hysterectomy
Interventions	Placebo, haloperidol 2 mg, haloperidol 1 mg, haloperidol, haloperidol 0.25 mg

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Dag 2020 *(Continued)*

Outcomes	Heart rate, systolic arterial pressure, diastolic arterial pressure, level of sedation, visual analog scale values, antiemetic need, patient satisfaction, side effects
Notes	Study identified in search update; data will be included in next update of the review

Danner 2001

Methods	Randomized controlled trial
Participants	Patients undergoing thyroid surgery, ASA I to III
Interventions	Dolasetron 50 mg given orally 45 minutes before induction or dolasetron 12.5 mg given intravenously during induction or droperidol 1.25 mg given intravenously during induction or placebo
Outcomes	PONV (complete response, total response)
Notes	Mail sent on 4th of April 2018 and again on July 31st 2018; reason for request was missing information about mean age or range; no response received

DebanSingh 2009

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy, 18 to 65 years of age, ASA I and II
Interventions	Dexamethasone (8 mg) with granisetron (40 µg/kg) or granisetron (40 µg/kg) alone 1 minute before induction
Outcomes	PONV
Notes	No full text available

de Morais 2018

Methods	Randomized controlled trial
Participants	Patients scheduled for laparoscopic procedures to treat abdominal or pelvic cancer, 18 to 70 years of age, ASA status I or II, Apfel score of 3 or 4
Interventions	Oral starch (control group) or 80 mg oral aprepitant (treatment group) 1 hour before induction
Outcomes	PONV, adverse effects
Notes	Study identified after the first search; data will be included in next update of the review

Doenicke 2004

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Doenicke 2004 *(Continued)*

Participants	Patients undergoing surgery from different disciplines (general surgery, orthopaedic surgery, and urology)
Interventions	5 mg/kg cimetidine i.v. + 0.1 mg/kg dimetindene i.v. (20 minutes before induction of anaesthesia), 1.25 mg/kg ranitidine i.v. + 0.1 mg/kg dimetindene i.v. (20 minutes before induction of anaesthesia), 300 mg ranitidine p.o. + 0.1 mg/kg dimetindene i.v. (1 to 2 hours before induction of anaesthesia), 20 mL saline solution i.v. (20 minutes before induction of anaesthesia)
Outcomes	Nausea, vomiting
Notes	Study identified in search update; data will be included in next update of the review

Dundee 1966

Methods	Randomized controlled trial
Participants	Female patients undergoing minor gynaecological operation
Interventions	Cyclizine 50 mg IM or trimethobenzamide 200 mg IM as premedication before anaesthesia
Outcomes	PONV, drowsiness, apprehension, restlessness or excitement, dizziness, pain at injection site, tachycardia, hypotension
Notes	Missing information about range of age; no contact details available

Dundee 1974

Methods	Randomized controlled trial
Participants	Female patients undergoing minor gynaecological operation
Interventions	Metoclopramide 10 mg IM or metoclopramide 20 mg IM or placebo IM as premedication
Outcomes	PONV, drowsiness, apprehension, restlessness or excitement, dizziness
Notes	Missing information about range of age; no contact details available

Dundee 1975

Methods	Randomized controlled trial
Participants	Female patients undergoing minor gynaecological surgery
Interventions	Cyclizine 50 mg IM or perphenazine 2.5 mg IM or perphenazine 5 mg IM about 90 minutes before operating time
Outcomes	PONV, apprehension, restlessness
Notes	Missing information about range of age; no contact details available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Eryilmaz 2008

Methods	Randomized controlled trial
Participants	Patients undergoing aesthetic surgery
Interventions	Ondansetron or metoclopramide as single drug prophylaxis in the postoperative recovery room
Outcomes	PONV
Notes	Mail sent on 10th of July 2018; reasons for request were missing information about randomisation and point of administration of antiemetics; no response received

EUCTR2004-004280-30-SE

Methods	Randomized controlled trial
Participants	Patients scheduled for inguinal hernia repair in Ludvika Hospital, 18 to 70 years of age
Interventions	Betamethasone or placebo
Outcomes	Pain
Notes	Study status (not yet recruiting), first posted (2004), missing information (anaesthesia regimen)

EUCTR2005-005928-13-IS

Methods	Randomized controlled trial
Participants	Patients scheduled to undergo gynaecological laparoscopic surgery at Landspitali University Hospital, female, older than 18 years of age
Interventions	Scopalamine or placebo
Outcomes	PONV, pain
Notes	Study status (recruiting), first posted (2006), missing information (anaesthesia regimen, comparator)

EUCTR2006-001761-42-LT

Methods	Randomized controlled trial
Participants	Patients scheduled to undergo open abdominal surgery or laparoscopically assisted vaginal hysterectomy requiring overnight hospital stay (24-hour hospital stay after surgery); general anaesthesia, including induction agents, narcotics, neuromuscular blocking agents, and maintenance with nitrous oxide (50% to 70%) with volatile anaesthetic; postoperative opioids by IM or IV route or by IV patient-controlled analgesia, older than 18 years of age
Interventions	Aprepitant (40 mg) or ondansetron (4 mg)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

EUCTR2006-001761-42-LT *(Continued)*

Outcomes	No vomiting, no nausea, complete response, side effects
Notes	Study status (not yet recruiting), first posted (2006), missing information (time point of administration)

EUCTR2010-019899-77-DK

Methods	Randomized controlled trial
Participants	Patients undergoing elective laparoscopic groin hernia repair, unilateral, ASA I and II, 18 to 85 years of age, male
Interventions	Dexamethasone (8 mg) or placebo
Outcomes	Pain, fatigue, PONV, nausea, vomiting
Notes	Study status (not yet recruiting), first posted (2010), missing information (anaesthesia regimen, time point of administration)

EUCTR2015-003956-32-SE

Methods	Randomized controlled trial
Participants	Patients having ambulatory surgery, older than 18 years of age, no pregnancy, ASA I and II
Interventions	Palonosetron or placebo
Outcomes	PONV, complete response, adverse events
Notes	Study status (recruiting), first posted (2016), missing information (anaesthesia regimen)

Gnanasekar 2018

Methods	Randomized controlled trial
Participants	Patients undergoing lower abdominal surgery in multiple specialties
Interventions	8 mg dexamethasone or 2 mL saline
Outcomes	Pain scores, morphine consumption, occurrence of nausea and vomiting
Notes	Study identified in search update; data will be included in next update of the review

Goutarel 1977

Methods	Randomized controlled trial
Participants	Patients undergoing general anaesthesia

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Goutarel 1977 *(Continued)*

Interventions	Metoclopramide or placebo
Outcomes	Postoperative vomiting
Notes	No full text available

Gu 1998

Methods	Randomized controlled trial
Participants	NA
Interventions	Droperidol injected different ways
Outcomes	PONV
Notes	No full text available

Gulhas 2003

Methods	Randomized controlled trial
Participants	Patients undergoing middle ear surgery
Interventions	Orally administered ginger (1 gr with 30 mL water) or ondansetron (8 mg with 30 mL water) tablet or placebo (only 30 mL water) 1 hour before surgery
Outcomes	PONV
Notes	No full text available

Gupta 2020

Methods	Randomized controlled trial
Participants	Patients undergoing upper abdominal surgery
Interventions	4 mg ondansetron or 0.075 mg palonosteron i.v. at end of surgery
Outcomes	Nausea, vomiting, need for rescue antiemetic
Notes	Study identified in search update; data will be included in next update of the review

Handley 1967

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Handley 1967 *(Continued)*

Participants	Female patients undergoing cervical dilatation or dilatation and curettage, younger than 60 years of age
Interventions	Metoclopramide 10 mg IM or perphenazine 5 mg IM or normal saline IM at end of surgery
Outcomes	PONV
Notes	Missing information about range of age; no contact details available

Heidari 2018

Methods	Randomized controlled trial
Participants	Adult patients undergoing laparoscopic cholecystectomy
Interventions	Dexamethasone (0.15 mg/kg), metoclopramide (10 mg), and placebo
Outcomes	Pain, nausea, vomiting, amount of anti-nausea drug administered
Notes	Study identified in search update; needs translation (Persian)

Hossain 2019

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy
Interventions	4 mg ondansetron, 0.075 mg palonosteron, or 2 mg granisetron i.v. before induction of anaesthesia
Outcomes	Nausea, vomiting
Notes	Study identified in search update; data will be included in next update of the review

Hussain 2011

Methods	Randomized controlled trial
Participants	Female patients undergoing laparoscopic cholecystectomy, 35 to 70 years of age, ASA I or II
Interventions	Ondansetron 4 mg IV, metoclopramide 10 mg IV, or saline 2 minutes before induction
Outcomes	Complete response, nausea, vomiting
Notes	No full text available

Hyman 2020

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Hyman 2020 *(Continued)*

Participants	Adult female patients ≤ 50 years of age, undergoing ambulatory gynaecological or plastic surgery
Interventions	Ondansetron (4 mg) plus dexamethasone (8 mg) with the addition of olanzapine relative to placebo
Outcomes	Nausea, vomiting, side effects
Notes	Study identified in search update; data will be included in next update of the review

Iannuzzi 1994

Methods	Randomized controlled trial
Participants	NA
Interventions	Ondansetron 4 mg or no treatment 5 to 10 minutes before induction
Outcomes	PONV
Notes	Missing information about study design; no contact details available

Ibrahim 1999

Methods	Randomized controlled trial
Participants	Patients undergoing middle ear surgery
Interventions	Ondansetron or placebo
Outcomes	PONV
Notes	No full text available

Imam 2004

Methods	Randomized controlled trial
Participants	Patients undergoing elective caesarean section under general anaesthesia
Interventions	IV ondansetron 4 mg with dexamethasone 8 mg or ondansetron 4 mg alone or placebo at induction
Outcomes	PONV
Notes	No full text available

IRCT138902253931N1

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

IRCT138902253931N1 *(Continued)*

Participants	Patients undergoing laparoscopic cholecystectomy
Interventions	Dexamethasone (8 mg) 90 minutes before surgery or normal saline (2 cc) 90 minutes before surgery
Outcomes	PONV
Notes	Study status (completed), first posted (2010), missing information (anaesthesia regimen)

IRCT201008254505N1

Methods	Randomized controlled trial
Participants	Patients having elective inguinal hernia surgery, weight < 100 kg, 20 to 40 years of age, no severe or chronic illness, ASA I and II
Interventions	Metoclopramide (10 mg) before extubation and 6 hours after operation or dexamethasone (8 mg) before extubation and 6 hours after operation
Outcomes	Nausea, vomiting
Notes	Study status (completed), first posted (2010), missing information (anaesthesia regimen, outcomes)

IRCT201009084715N1

Methods	Randomized controlled trial
Participants	Patients undergoing elective cholecystectomy with laparoscopic method, 16 to 60 years of age
Interventions	Ondansetron (4 mg) and dexamethasone (8 mg) 5 minutes before end of surgery or metoclopramide (10 mg) and dexamethasone (8 mg) 5 minutes before end of surgery
Outcomes	Nausea, vomiting
Notes	Study status (completed), first posted (2010), missing information (anaesthesia regimen, age)

IRCT201012133181N3

Methods	Randomized controlled trial
Participants	Patients undergoing stapedectomy surgery who were referred to ENT clinic of Amiralam Hospital, ASA I and II, 15 to 62 years of age
Interventions	Dexamethasone (16 mg) a half hour before surgery or normal saline (4 mL) a half hour before surgery
Outcomes	PONV, vertigo
Notes	Study status (completed), first posted (2012), missing information (anaesthesia regimen, age)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

IRCT201105056392N1

Methods	Randomized controlled trial
Participants	Participants referred for elective laparoscopic cholecystectomy, 20 to 65 years or older
Interventions	Ondansetron (4 mg) immediately before receiving general anaesthesia or dexamethasone (8 mg) immediately before receiving general anaesthesia or ondansetron (4 mg) and dexamethasone (8 mg) immediately before receiving general anaesthesia
Outcomes	Nausea, vomiting
Notes	Study status (completed), first posted (2011), missing information (anaesthesia regimen)

IRCT201108067093N2

Methods	Randomized controlled trial
Participants	Patients having orthopaedic surgery under balanced anaesthesia, ASA I and II, 16 to 65 years of age, BMI < 30
Interventions	Ondansetron (4 mg) or metoclopramide (4 mg) or dexamethasone (4 mg) or ondansetron (4 mg) and metoclopramide (4 mg) or ondansetron (4 mg) and dexamethasone (4 mg) or metoclopramide (4 mg) and dexamethasone (4 mg) or placebo
Outcomes	PONV
Notes	Study status (completed), first posted (2012), missing information (anaesthesia regimen, age, time point of administration)

IRCT201108147324N1

Methods	Randomized controlled trial
Participants	Patients who are candidates for maxillofacial surgery, 18 to 50 years of age, undergoing IMF
Interventions	Ondansetron (0.15 mg/kg) 30 minutes before surgery or ondansetron (0.15 mg/kg) 30 minutes before end of surgery or metoclopramide (0.5 mg/kg) 30 minutes before surgery or metoclopramide (0.5 mg/kg) 30 minutes before end of surgery or placebo
Outcomes	Nausea, vomiting, vertigo
Notes	Study status (completed), first posted (2012), missing information (anaesthesia regimen)

IRCT201112088329N1

Methods	Randomized controlled trial
Participants	Patients undergoing general anaesthesia for elective laparoscopic cholecystectomy in Mostafa Khomeini Hospital, 18 to 60 years of age

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

IRCT201112088329N1 *(Continued)*

Interventions	Dexamethasone (8 mg) or metoclopramide (10 mg) or normal saline (0.9%)
Outcomes	Vomiting, nausea
Notes	Study status (completed), first posted (2012), missing information (anaesthesia regimen, time point of administration)

IRCT201207223915N7

Methods	Randomized controlled trial
Participants	Patients are candidates for tympanoplasty, ASA I and II, 15 to 60 years of age
Interventions	Dexamethasone (8 mg) after intubation and granisetron (0.1 mg) 15 minutes before extubation or dexamethasone (8 mg) after intubation and granisetron (0.3 mg) 15 minutes before extubation or dexamethasone (8 mg) and ondansetron (4 mg) 15 minutes before extubation
Outcomes	PONV
Notes	Study status (completed), first posted (2012), missing information (anaesthesia regimen, age)

IRCT201208075225N2

Methods	Randomized controlled trial
Participants	Patients scheduled for tympanomastoidectomy under general anaesthesia, ASA I and II, 20 to 60 years of age
Interventions	Dexamethasone (8 mg) 1 hour before surgery and placebo 1 hour before surgery
Outcomes	PONV
Notes	Study status (completed), first posted (2012), missing information (anaesthesia regimen)

IRCT2014012511700N3

Methods	Randomized controlled trial
Participants	Patients who have an outpatient gynaecological diagnostic laparoscopy, 20 to 50 years of age, female, ASA I and II
Interventions	Dexamethasone (8 mg) before induction of anaesthesia or dexamethasone (8 mg) and ondansetron (4 mg) before induction of anaesthesia or ondansetron (4 mg) before induction of anaesthesia
Outcomes	PONV
Notes	Study status (completed), first posted (2014), missing information (anaesthesia regimen)

IRCT2015042715281N3

Methods	Randomized controlled trial
Participants	Patients who were candidates for orthopaedic surgery, men, 16 to 65 years of age, ASA I and II
Interventions	Metoclopramide (10 mg) or granisetron (3 mg) or dexamethasone (8 mg)
Outcomes	PONV
Notes	Study status (completed), first posted (2015), missing information (anaesthesia regimen, age, time point of administration)

IRCT2016030126853N1

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy
Interventions	Dexamethasone (8 mg) 30 minutes before operation or no drugs
Outcomes	Pain, nausea
Notes	Study status (completed), first posted (2016), missing information (anaesthesia regimen, age)

IRCT2016120831302N1

Methods	Randomized controlled trial
Participants	Patients having laparoscopic cholecystectomy, female, 18 to 50 years of age, ASA I and II, 2 or more criteria of Apfel
Interventions	Ondansetron (4 mg) after anaesthetic induction and placed 1 hour before operation or aprepitant (80 mg) 1 hour before operation and placebo after anaesthetic induction or aprepitant (80 mg) 1 hour before operation and ondansetron (4 mg) after anaesthetic induction
Outcomes	PONV
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen)&&

IRCT2016122019359N8

Methods	Randomized controlled trial
Participants	Patients 15 to 60 years of age, ASA I and II
Interventions	Dexamethasone (0.1 mg/kg) or no prophylactic interventions
Outcomes	Nausea, vomiting

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

IRCT2016122019359N8 *(Continued)*

Notes	Study status (completed), first posted (2016), missing information (anaesthesia regimen, age, time point of administration)

IRCT2017010923559N7

Methods	Randomized controlled trial
Participants	Patients with biliary colic pain or uncomplicated gallstone undergoing laparoscopic cholecystectomy, 18 to 65 years of age
Interventions	Intravenous dexamethasone (8 mg) with ondansetron or intravenous dexamethasone (8 mg) with Plasil (10 mg) during surgery
Outcomes	Nausea, vomiting, shivering within 24 hours postoperatively
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen)

IRCT2017011920588N5

Methods	Randomized controlled trial
Participants	Patients with strabismus surgery under general anaesthesia, ASA I and II, 18 to 65 years of age
Interventions	Ondansetron (0.05 mg/kg) or placebo (NaCl 0.9%) or metoclopramide (0.15 mg/kg)
Outcomes	Nausea, vomiting, side effects
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen, time point of administration)

IRCT2017020725732N13

Methods	Randomized controlled trial
Participants	Patients scheduled for laparoscopic cholecystectomy, 18 to 80 years of age, ASA I and II
Interventions	Dexamethasone (16 mg) before first surgery incision or ondansetron (4 mg) before first surgery incision or dexamethasone (8 mg) and ondansetron (4 mg) before first surgery incision
Outcomes	PONV
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen)

IRCT2017031433069N1 *(Continued)*

Participants	Patients having elective gynaecological surgery under general anaesthesia, 18 to 45 years of age, ASA I and II, female
Interventions	Metcolopramide (10 mg) or ondansetron (4 mg)
Outcomes	Pain
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen, outcomes, randomization)

Isazadehfar 2016

Methods	Randomized controlled trial
Participants	Participants 6 to 81 years of age (majority over 18 years), ASA I and II, undergoing laparoscopic cholecystectomy
Interventions	Ondansetron (4 mg IV before induction of anaesthesia), dexamethasone (8 mg IV before induction of anaesthesia), placebo
Outcomes	Vomiting, nausea
Notes	Another publication by the same author (Isazadehfar 2017) reported identical baseline data for patients in the ondansetron group. Request to authors was sent but remains unanswered

Isazadehfar 2017

Methods	Randomized controlled trial
Participants	Participants 15 to 80 years of age (most over 18 years), ASA I or II, scheduled for elective laparoscopic cholecystectomy surgery
Interventions	Ondansetron (4 mg IV before anaesthesia induction), metoclopramide (10 mg IV before anaesthesia induction)
Outcomes	Vomiting, nausea
Notes	Another publication by the same author (Isazadehfar 2016) reported identical baseline data for patients in the ondansetron group. Request to authors was sent but remains unanswered

ISRCTN07711014

Methods	Randomized controlled trial
Participants	Patients undergoing day surgery with general anaesthesia
Interventions	Cyclizine (50 mg) at beginning of anaesthetic induction, ondansetron (4 mg) at beginning of anaesthetic induction, granisetron (1 mg) at beginning of anaesthetic induction, placebo
Outcomes	PONV

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

ISRCTN07711014 *(Continued)*

Notes	Study status (completed), first posted (2005), missing information (anaesthesia regimen, age)

ISRCTN18556628

Methods	Randomized controlled trial
Participants	Patients undergoing daycase gynaecological laparoscopy, female, older than 18 years of age
Interventions	Cyclizine (50 mg) or dexamethasone (8 mg) and cyclizine (50 mg) or placebo (saline 0.9%)
Outcomes	Vomiting, retching, nausea, pain
Notes	Study status (completed), first posted (2005), missing information (anaesthesia regimen, outcomes, time point of administration)

ISRCTN21871435

Methods	Randomized controlled trial
Participants	Patients undergoing abdominal hysterectomy, female, ASA I to III
Interventions	NA
Outcomes	NA
Notes	Study status (completed), first posted (2003), missing information (anaesthesia regimen, age)

Janknegt 1999

Methods	Randomized controlled trial
Participants	NA
Interventions	Droperidol 1.25 mg IV or granisetron 1 mg IV or granisetron 1 mg IV with dexamethasone 5 mg IV
Outcomes	PONV
Notes	Missing information about anaesthesia regimen; no contact details available

Jensen 2020

Methods	Randomized controlled trial
Participants	Patients undergoing abdominal wall reconstruction
Interventions	125 mg methylprednisolone or placebo i.v. at induction of anaesthesia
Outcomes	Pain, nausea, fatigue

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Jensen 2020 *(Continued)*

Notes	Study identified in search update; data will be included in next update of the review

Jeyabalan 2019

Methods	Randomized controlled trial
Participants	Patients undergoing breast or thyroid surgery
Interventions	Ondansetron or aprepitant
Outcomes	PONV, patient satisfaction
Notes	Study identified in search update; data will be included in next update of the review&&

JPRN-UMIN000004167

Methods	Randomized controlled trial
Participants	Patients for surgical correction of bite, 18 to 40 years of age
Interventions	Aprepitant (125 mg) administered preoperatively or metoclopramide (10 mg) just before completion of surgery
Outcomes	Consumption of postoperative antiemetic agent
Notes	Study status (terminated), first posted (2010), missing information (anaesthesia regimen)

JPRN-UMIN000012365

Methods	Randomized controlled trial
Participants	Patients with breast cancer, 20 to 70 years of age, female
Interventions	Dexamethasone or saline
Outcomes	PONV
Notes	Study status (not yet recruiting), first posted (2013), missing information (anaesthesia regimen, time point of administration)

JPRN-UMIN000018532

Methods	Randomized controlled trial
Participants	Patients who received oral surgery, 20 to 80 years of age, ASA I to III
Interventions	Fosaprepitant (150 mg) before induction of anaesthesia or ondansetron (4 mg) before induction of anaesthesia

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

JPRN-UMIN000018532 *(Continued)*

Outcomes	PONV
Notes	Study status (completed), first posted (2015), missing information (anaesthesia regimen)

JPRN-UMIN000024653

Methods	Randomized controlled trial
Participants	Patients who are surgery patients receiving antiemetics
Interventions	NA
Outcomes	PONV
Notes	Study status (completed), first posted (2016), missing information (no information provided)

Kamali 2018

Methods	Randomized controlled trial
Participants	Patients undergoing abdominal hysterectomy
Interventions	4 mg ondansetron or 2 mg haloperidol i.v.
Outcomes	Vomiting
Notes	Study identified in search update; data will be included in next update of the review

Karacinar 2009

Methods	Randomized controlled trial
Participants	Patients undergoing elective craniotomy
Interventions	Dexamethasone (4 mg, 8 mg, 16 mg) or placebo i.v. after intubation
Outcomes	Nausea, vomiting, blood glucose
Notes	Study identified in search update; needs translation (Turkish)

Kashmiri 2006

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy, ASA I and II
Interventions	Dexamethasone 8 mg or normal saline IV just before induction

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Kashmiri 2006 *(Continued)*

Outcomes	PONV
Notes	No full text available

KCT0000122

Methods	Randomized controlled trial
Participants	Patients undergoing craniotomy, older than 21 years of age
Interventions	Palonosetron (0.075 mg) immediately (no more than 5 minutes) before end of surgery or ondansetron (8 mg) immediately (no more than 5 minutes) before end of surgery or ramosetron (0.3 mg) immediately (no more than 5 minutes) before end of surgery
Outcomes	PONV, nausea
Notes	Study status (recruiting), first posted (2011), missing information (anaesthesia regimen)

KCT0000336

Methods	Randomized controlled trial
Participants	Patients undergoing elective pelviscopic gynaecological surgery or breast operation, 19 to 65 years of age, ASA I and II, female
Interventions	Palonosetron (0.075 mg) before end of surgery or ondansetron (8 mg) before end of surgery
Outcomes	Nausea, retching, vomiting, complete response, pain
Notes	Study status (recruiting), first posted (2012), missing information (anaesthesia regimen)

KCT0000487

Methods	Randomized controlled trial
Participants	Patients undergoing elective abdominal surgery, 20 to 70 years of age, ASA I and II
Interventions	Palonosetron (0.075 mg) at end of surgery or placebo
Outcomes	PONV, pain
Notes	Study status (recruiting), first posted (2012), missing information (anaesthesia regimen)

KCT0000809

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

KCT0000809 *(Continued)*

Participants	Patients scheduled for elective operation under general anaesthesia, female, 20 to 70 years of age, PCA
Interventions	Ondansetron (8 mg) 30 minutes before end of surgery or palonosetron (0.075 mg) 30 minutes before end of surgery
Outcomes	PONV, side effects, nausea
Notes	Study status (completed), first posted (2013), missing information (anaesthesia regimen)

KCT0000899

Methods	Randomized controlled trial
Participants	Patients scheduled to undergo thyroidectomy under general anaesthesia in Chung-Ang University Hospital, 2 or more risk factors for PONV, 20 to 65 years of age, female
Interventions	Palonosetron (0.075 mg) 10 minutes before induction of general anaesthesia or dexamethasone (5 mg) or palonosetron (0.075 mg) and dexamethasone (5 mg)
Outcomes	PONV, pain
Notes	Study status (not yet recruiting), first posted (2013), missing information (anaesthesia regimen)

KCT0001740

Methods	Randomized controlled trial
Participants	Patients with knee osteoarthritis who were scheduled to undergo total knee arthroplasty, 55 to 85 years of age
Interventions	Dexamethasone (10 mg) 1 hour before total knee arthroplasty or no steroid injection before total knee arthroplasty
Outcomes	Pain, nausea
Notes	Study status (recruiting), first posted (2015), missing information (anaesthesia regimen, outcomes)

KCT0002433

Methods	Randomized controlled trial
Participants	Patients undergoing elective surgery under general anaesthesia, PCA, 20 to 70 years of age, female
Interventions	Palonosetron (0.075 mg) after induction of anaesthesia or palonosetron (0.075 mg) after induction of anaesthesia and aprepitant (80 mg) 2 to 3 hours before the operation
Outcomes	PONV, adverse effects
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Khan 2011

Methods	Randomized controlled trial
Participants	Female patients undergoing laparoscopic cholecystectomy, ASA I and II
Interventions	Ondansetron 2 mg IV before induction or metoclopramide 10 mg IV before induction
Outcomes	PONV
Notes	Mail sent on 10th of July 2018; reason for request was missing information about whether anaesthesia regimen was standardized for all patients and way of maintaining anaesthesia; no response received

Kim 2002

Methods	Randomized controlled trial
Participants	Patients undergoing elective operation under general anaesthesia, 15 to 65 years of age, ASA I and II
Interventions	Metoclopramide 5 mg IV or metoclopramide 10 mg IV or saline IV
Outcomes	Pain
Notes	Mail sent on 21st of March 2018; reason for request was missing information about maintenance of anaesthesia; mail could not be delivered

Kim 2003

Methods	Randomized controlled trial
Participants	Female patients undergoing pelviscopic gynaecological procedure
Interventions	Ondansetron 1 mg or ondansetron 4 mg or ondansetron 8 mg or saline at end of pelviscopic operation
Outcomes	PONV
Notes	No full text available

Kimya 1996

Methods	Randomized controlled trial
Participants	Patients undergoing gynaecological laparotomy and laparoscopy
Interventions	Ondansetron 8 mg IV or no treatment immediately before induction
Outcomes	PONV, adverse effects

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Kimya 1996 *(Continued)*

Notes	Missing information about study design; no contact details available

Kleif 2018

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic surgery for suspected appendicitis
Interventions	125 mg methylprednisolone plus 4 mg ondansetron or placebo plus 4 mg ondansetron i.v. before surgery
Outcomes	Pain, quality of recovery, side effects
Notes	Study identified in search update; data will be included in next update of the review

Klenke 2018

Methods	Randomized controlled trial
Participants	Patients undergoing general anaesthesia for gynaecological; ear, nose, and throat; or endocrine surgery (thyroid)
Interventions	Acustimulation/dexamethasone, acustimulation/vehicle, sham acustimulation/dexamethasone, sham acustimulation/vehicle
Outcomes	PONV
Notes	Study identified in search update; data will be included in next update of the review

Koff 1968

Methods	Randomized controlled trial
Participants	NA
Interventions	Metoclopramide
Outcomes	Post-anaesthetic vomiting and nausea
Notes	No full text available

Kranke 2018

Methods	Randomized controlled trial
Participants	Patients undergoing elective surgery (open or laparoscopic) under general anaesthesia, expected to last at least 1 hour, 18 years of age or older, at least 3 Apfel risk factors

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Kranke 2018 *(Continued)*

Interventions	Intravenous amisulpride (5 mg) or matching placebo at induction of general anaesthesia, in addition to 1 standard non-dopaminergic antiemetic
Outcomes	PONV, adverse events
Notes	Study identified after first search; data will be included in next update of the review

Kumar 2018a

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy
Interventions	8 mg ondansetron or 0.075 mg palonosetron
Outcomes	Nausea, retching, vomiting, rescue antiemetic, side effect profile, patient satisfaction scores
Notes	Study identified in search update; data will be included in next update of the review

Kwak 2019

Methods	Randomized controlled trial
Participants	Patients undergoing breast surgery
Interventions	Dexmedetomidine 0.5 µg/kg or combination of dexmedetomidine 0.5 µg/kg and dexamethasone 5 mg at 30 minutes before end of surgery
Outcomes	PONV
Notes	Study identified in search update; data will be included in next update of the review

LabradorGoyeneche 1998

Methods	Randomized controlled trial
Participants	Patients undergoing gynaecological surgery
Interventions	After induction tropisetron 2 mg IV unique dose or metoclopramide 10 mg IV each 8 hours during 24 hours
Outcomes	PONV, adverse episodes
Notes	No full text available

Laveneziana 1978

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Laveneziana 1978 *(Continued)*

Participants	Female patients undergoing total laparoscopic hysterectomy, between 41 and 68 years of age
Interventions	Haloperidol 2 mg IM or sulpiride 100 mg IM 1 hour before surgery
Outcomes	Vomiting
Notes	Missing information about study design; no contact details available

Lazar 1984

Methods	Randomized controlled trial
Participants	Patients undergoing stapes replacement operation, 21 to 69 years of age
Interventions	Transdermal scopolamine or identical placebo patch on the evening before the operation
Outcomes	PONV, side effects (dryness of mouth urine retention, drowsiness, blurred vision)
Notes	Missing information about anaesthesia regimen; no contact details available

Lee 2020a

Methods	Randomized controlled trial
Participants	Patients undergoing retromastoid craniectomy with microvascular decompression
Interventions	TDS patch or sham patch
Outcomes	Nausea, vomiting, use of antiemetics
Notes	Study identified in search update; data will be included in next update of the review

Li 1999

Methods	Randomized controlled trial
Participants	Patients undergoing cholecystectomy under abdominoscope
Interventions	Ondansetron 8 mg IV or saline
Outcomes	PONV
Notes	Missing information about range of age; no contact details available

Liberman 2000

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Liberman 2000 *(Continued)*

Participants	Patients undergoing laparoscopic cholecystectomy, 15 to 65 years of age
Interventions	Ondansetron 4 mg IV or placebo at induction of anaesthesia
Outcomes	PONV
Notes	Missing information about standard deviation of age; no contact details available

Lind 1970c

Methods	Randomized controlled trial
Participants	Patients undergoing vaginal surgery, gynaecological laparotomy, or varices surgery, 20 to 69 years of age
Interventions	Scopolamine with perphenazine 5 mg IM or scopolamine with thioproperazine IM 0.5 mg or 1 mg or 2 mg dose right after end of anaesthesia
Outcomes	PONV, requirement for postoperative analgesics, sedation, blood pressure
Notes	Missing information about study design and dose of scopolamine; no contact details available

Liu 2019

Methods	Randomized controlled trial
Participants	Adult patients undergoing total knee arthroplasty
Interventions	Dexamethasone or saline
Outcomes	Pain, vomiting, use of antiemetics, side effects
Notes	Study identified in search update; needs translation (Chinese)

Makhdoom 2009

Methods	Randomized controlled trial
Participants	Female patients undergoing middle ear surgery, mean age 32.6 years, ASA I and II
Interventions	Dexamethasone 10 mg IV or midazolam 0.075 mg/kg or a combination of both or normal saline IV before induction
Outcomes	PONV, sedation, pain
Notes	Mail sent on 19th of March 2018; reason for request was missing information about age range for included patients; mail could not be delivered

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Malak 2017

Methods	Randomized controlled trial
Participants	Patients undergoing elective laparoscopic cholecystectomy
Interventions	Ondansetron (4 mg), cyclizine (50 mg), or prochlorperazine (10 mg)
Outcomes	PONV, need for rescue antiemetics, adverse effects (e.g. headache, dizziness, sedation)
Notes	Study identified in search update; data will be included in next update of the review

McKenzie 1981

Methods	Randomized controlled trial
Participants	Female patients undergoing first trimester abortion, ASA I and II
Interventions	Droperidol 2.5 mg IM or hydroxyzine 100 mg IM or saline IM immediately after induction of anaesthesia
Outcomes	PONV, drowsiness
Notes	Missing information about range of age; no contact details available

McKenzie 1996

Methods	Randomized controlled trial
Participants	Female patients undergoing laparoscopic tubal banding, ASA I and II
Interventions	Droperidol 1.25 mg IV with ondansetron 4 mg IV or droperidol 1.25 mg IV with saline within 15 minutes after induction of anaesthesia
Outcomes	PONV, drowsiness, pain, adverse events
Notes	Missing information about range of age; no contact details available

McNeill 1995

Methods	Randomized controlled trial
Participants	Patients undergoing operation for spinal stenosis or herniated intervertebral disc
Interventions	Methylprednisolone 40 mg epidurally or placebo epidurally or morphine 5 mg epidurally or methylprednisolone 40 mg with morphine 5 mg epidurally at end of operation
Outcomes	Pain, nausea, itching, apnoea, urinary retention
Notes	Missing information about anaesthesia regimen and range of age; no contact details available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Michaloudis 1993

Methods	Randomized controlled trial
Participants	Female patients undergoing laparoscopy, ASA I and II
Interventions	Droperidol 0.5 mg IV with metoclopramide 5 mg IV and hyoscine 0.1 mg IV or droperidol 1.25 mg IV and saline IV 10 minutes before end of surgery
Outcomes	PONV
Notes	Missing information about range of age

Mirhosseini 2011

Methods	Randomized controlled trial
Participants	Patients with severe left ventricle dysfunction undergoing coronary artery bypass graft surgery
Interventions	Methyprednisolone 5 mg/kg IV or normal saline after induction of anaesthesia
Outcomes	Postoperative atrial fibrillation, bleeding, infection, vomiting, respiratory and renal dysfunction, mortality, ICU and hospital stay
Notes	Mail sent on 21st of March 2018 and again on 31st of July 2018; reason for request was missing information about time point for assessment of vomiting and infection; no response received

Modir 2019a

Methods	Randomized controlled trial
Participants	Patients undergoing thympanomastoidectomy
Interventions	Dexamethasone (0.1 mg/kg) or metoclopramide (0.15 mg/kg) i.v.
Outcomes	PONV, vomiting
Notes	Study identified in search update; data will be included in next update of the review

Moradi 2019

Methods	Randomized controlled trial
Participants	Adult patients undergoing strabismus surgery
Interventions	0.1 mg/kg metoclopramide or 0.05 mg/kg ondansetron
Outcomes	Nausea, vomiting, drug complications, satisfaction
Notes	Study identified in search update; needs translation (Persian)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Moradi Farsani 2017

Methods	Randomized controlled trial
Participants	Adult patients undergoing cataract surgery
Interventions	0.1 mg/kg metoclopramide or placebo
Outcomes	Pain, vomiting, use of antiemetics
Notes	Study identified in search update; needs translation (Persian)

Naghibi 2018

Methods	Randomized controlled trial
Participants	Adult patients undergoing cataract surgery
Interventions	Dexamethasone, ondansetron, or saline
Outcomes	Itching, nausea and vomiting
Notes	Study identified in search update; needs translation (Persian)

NCT00231777

Methods	Randomized controlled trial
Participants	Patients ≥ 18 years of age and scheduled to undergo open abdominal surgery or vaginal hysterectomy requiring overnight hospital stay (24-hour hospital stay after end of surgery)
Interventions	Fosaprepitant 40 mg IV or ondansetron 4 mg before surgery
Outcomes	Clinical adverse experiences, laboratory adverse experiences, drug-related clinical adverse experiences, serious clinical adverse experiences, constipation, arrhythmia, headache
Notes	Study protocol with study results; missing information on whether general anaesthesia was standardized for all groups; Sponsor Merck

NCT00445055

Methods	Randomized controlled trial
Participants	Patients scheduled for thyroid surgery, female, older than 18 years of age, Apfel score ≥ 2, ASA I and II
Interventions	Droperidol (0.625 mg) 30 minutes before end of anaesthesia or droperidol (2.5 mg) 30 minutes before end of anaesthesia or saline 30 minutes before end of anaesthesia
Outcomes	No vomiting, nausea, adverse events

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT00445055 *(Continued)*

Notes	Study status (terminated), first posted (2007), missing information (anaesthesia regimen)

NCT00674713

Methods	Randomized controlled trial
Participants	Patients scheduled for elective laparoscopic cholecystectomy, 18 to 70 years of age, ASA I and II
Interventions	Ondansetron plus sham acupuncture or saline solution plus sham acupuncture
Outcomes	PONV
Notes	Study status (completed), first posted (2008), missing information (anaesthesia regimen)

NCT00702442

Methods	Randomized controlled trial
Participants	Patients scheduled for laparoscopic cholecystectomy, older than 18 years of age
Interventions	Saline solution 30 minutes before surgery or droperidol (0.625 mg) 30 minutes before laparoscopic cholecystectomy
Outcomes	Vomiting, nausea, adverse events
Notes	Study status (completed), first posted (2008), missing information (anaesthesia regimen)

NCT00738621

Methods	Randomized controlled trial
Participants	Female patients undergoing ambulatory breast surgery under general anaesthesia, 18 to 65 years of age, 2 risk factors associated with PONV, ASA status I to III
Interventions	Oral aprepitant (40 mg) within 3 hours before induction, dexamethasone (4 mg) after induction and ondansetron (4 mg) at cessation of anaesthesia or oral aprepitant (40 mg) within 3 hours before induction, dexamethasone (4 mg) after induction and placebo at cessation of anaesthesia
Outcomes	Vomiting
Notes	Study identified after first search; data will be included in next update of the review

NCT00835965

Methods	Randomized controlled trial
Participants	Patients with high risk of PONV (≥ 2 risk factors for PONV), older than 18 years of age, ASA I to III

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT00835965 *(Continued)*

Interventions	Aprepitant (40 mg PO 1 time at least 1 hour before induction of anaesthesia) and dexamethasone (5 mg iv following endotracheal intubation) or aprepitant (40 mg PO 1 time at least 1 hour before induction of anaesthesia) and placebo dexamethasone
Outcomes	Incidence of nausea and vomiting, need for rescue medication
Notes	Study status (unknown), first posted (2009), missing information (anaesthesia regimen)

NCT01013012

Methods	Randomized controlled trial
Participants	Patients having spine surgery, 18 to 65 years of age, female
Interventions	Ramosetron (6 mcg) and saline (1 mL) or ramosetron (6 mcg) and dexamethasone (4 mg)
Outcomes	PONV
Notes	Study status (completed), first posted (2009), missing information (anaesthesia regimen, time point of administration)

NCT01022528

Methods	Randomized controlled trial
Participants	Patients scheduled for elective total abdominal hysterectomy (with or without salpingo-oophorectomy or minor bladder repair) or myomectomy through a lower transverse or low midline incision under general anaesthesia, incidental appendectomy and/or abdominal lipectomy, 18 to 65 years of age, female, non-lactating
Interventions	Dexamethasone (0.1 mg/kg) 1.5 hours before induction of anaesthesia or dexamethasone (0.2 mg/kg) 1.5 hours before induction of anaesthesia or saline
Outcomes	Pain
Notes	Study status (completed), first posted (2009), missing information (anaesthesia regimen)

NCT01055236

Methods	Randomized controlled trial
Participants	Patients scheduled for elective transabdominal hysterectomy under combined spinal-general anaesthesia, 18 to 60 years of age, ASA I and II, BMI < 35
Interventions	Hydroxyzine (75 mg) at least half hour before operation or placebo
Outcomes	Pruritus, PONV
Notes	Study status (completed), first posted (2010), missing information (outcome)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT01149616

Methods	Randomized controlled trial
Participants	Participant over 18 years of age undergoing outpatient knee surgery
Interventions	Dexamethasone 8 mg IV or placebo, time point of administration unclear
Outcomes	Pain, nausea
Notes	Study protocol with study results. No information on anaesthesia regimen or time point of dexamethasone administration provided. Study terminated (investigators changed jobs, no longer affiliated with institution)

NCT01159548

Methods	Randomized controlled trial
Participants	Patients undergoing ambulatory gynaecological laparoscopic procedures ≥ 30 minutes in duration, 18 to 60 years of age, ASA I to III, ≥ 2 risk factors
Interventions	Promethazine (6.25 mg) or promethazine (3 mg) or saline
Outcomes	Absence of emetic episode
Notes	Study status (terminated), first posted (2010), missing information (anaesthesia regimen)

NCT01402622

Methods	Randomized controlled trial
Participants	Patients undergoing robot-assisted laparoscopic radical prostatectomy, 50 to 70 years of age, male, ASA I and II
Interventions	Ramosetron (0.3 mg) at end of surgery (balanced anaesthesia) or ramosetron (0.3 mg) at end of surgery (TIVA) or no antiemetic prophylaxis (TIVA)
Outcomes	PONV
Notes	Study status (completed), first posted (2011), missing information (anaesthesia regimen)

NCT01427127

Methods	Randomized controlled trial
Participants	Patients scheduled for laparoscopic colorectal surgery, 20 to 70 years of age, ASA I or II
Interventions	Ramosetron (0.3 mg) at end of surgery and 24 hours after surgery or saline at end of surgery and 24 hours after surgery

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT01427127 *(Continued)*

Outcomes	PONV
Notes	Study status (unknown), first posted (2011), missing information (anaesthesia regimen, study design)

NCT01524731

Methods	Randomized controlled trial
Participants	Patients scheduled for non-oncological gynaecological laparotomy, 18 to 80 years of age, female
Interventions	Ondansetron (4 mg) before tracheal extubation and saline immediately after induction of anaesthesia or ondansetron (4 mg) before tracheal extubation and dexamethasone (4 mg) immediately after induction of anaesthesia or ondansetron (4 mg) before tracheal extubation and dexamethasone (8 mg) immediately after induction of anaesthesia
Outcomes	PONV, pain
Notes	Study status (completed), first posted (2012), missing information (anaesthesia regimen)

NCT01612702

Methods	Randomized controlled trial
Participants	Participants over 18 years of age, undergoing total knee arthroplasty
Interventions	Ramosetron (NA) + dexamethasone (10 mg IV, 1 hour before surgery) or placebo
Outcomes	PONV, pain, wound complications, any AE, serious adverse events
Notes	Study protocol with study results; anaesthesia regimen and details on ramosetron administration (dose/time point) unclear

NCT01637545

Methods	Randomized controlled trial
Participants	Patients considered as surgical candidates with facial bone fracture, age (child, adult, older adult)
Interventions	Ramosetron (0.3 mg) just before beginning of surgery or ramosetron (0.3 mg) after end of surgery or regular antiemetics if patient wants
Outcomes	PONV
Notes	Study status (terminated), first posted (2012), missing information (anaesthesia regimen, age)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT01679093

Methods	Randomized controlled trial
Participants	Patients undergoing thyroidectomy without lymph node dissection, 18 to 70 years of age, ASA I to III, Apfel score equal to 2
Interventions	Ondansetron (4 mg) after induction of anaesthesia or droperidol (1.25 mg) after induction of anaesthesia or dexamethasone (4 mg) after induction of anaesthesia
Outcomes	Pain, PONV
Notes	Study status (completed), first posted (2012), missing information (anaesthesia regimen)

NCT01811251

Methods	Randomized controlled trial
Participants	Patients undergoing lumbar slipped disc surgery, 18 to 85 years of age, ASA I to III
Interventions	Dexamethasone (20 mg/5 mL) or placebo
Outcomes	Pain, PONV, side effects
Notes	Study status (completed), first posted (2013), missing information (anaesthesia regimen)

NCT02011659

Methods	Randomized controlled trial
Participants	Patients undergoing gynaecological laparoscopic surgery, 18 to 70 years of age, female, ASA I and II, non-smoker
Interventions	Ramosetron or placebo
Outcomes	PONV, adverse events
Notes	Study status (unknown), first posted (2013), missing information (anaesthesia regimen)

NCT02234466

Methods	Randomized controlled trial
Participants	Patients undergoing general anaesthesia for elective breast surgery, 18 to 80 years of age, ASA I to III
Interventions	Dexamethasone (two 4 mg tabs) 2 hours pre-induction and ondansetron (6 mg) at time of skin closure or gelatin pill and ondansetron (6 mg) at time of skin closure
Outcomes	PONV
Notes	Study status (unknown), first posted (2014), missing information (anaesthesia regimen)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT02304250

Methods	Randomized controlled trial
Participants	Patients having elective total thyroidectomy or hemithyroidectomy with lymphadenectomy for thyroid cancer, 18 to 65 years of age
Interventions	Dexamethasone (5 mg) after general anaesthesia induction or saline (1 mL) after general anaesthesia induction
Outcomes	Pain, PONV, side effects
Notes	Study status (completed), first posted (2014), missing information (anaesthesia regimen)

NCT02416115

Methods	Randomized controlled trial
Participants	Patients scheduled for gynaecological surgery under general anaesthesia and postoperative analgesia with a PCA device, age (child, adult, older adult), female, ASA I and II
Interventions	Ramosetron (0.3 mg) 30 minutes before end of surgery or saline 30 minutes before surgery
Outcomes	PONV
Notes	Study status (completed), first posted (2015), missing information (anaesthesia regimen, age)

NCT02431286

Methods	Randomized controlled trial
Participants	Patients submitted to breast cancer surgery, non-smokers, female, 18 to 70 years of age
Interventions	Aprepitant (80 mg) 1 hour before surgery and palonosetron (0.075 mg) and dexamethasone (4 mg) administered intraoperatively or saline 1 hour before surgery and palonosetron (0.075 mg) and dexamethasone (4 mg) administered intraoperatively
Outcomes	PONV, pain
Notes	Study status (unknown), first posted (2015), missing information (anaesthesia regimen)

NCT02510157

Methods	Randomized controlled trial
Participants	Patients scheduled for laparoscopic cholecystectomy, 18 to 70 years of age, duration of operation < 3 hours
Interventions	Dexamethasone before induction of anaesthesia or saline before induction of anaesthesia

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT02510157 *(Continued)*

Outcomes	Pain, PONV
Notes	Study status (completed), first posted (2015), missing information (anaesthesia regimen)

NCT02525848

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic gynaecological surgery under general anaesthesia, 18 to 45 years of age, ASA I and II
Interventions	Dexamethasone (8 mg) 2 minutes before induction of anaesthesia or dexamethasone (8 mg) 2 minutes before induction of anaesthesia and aprepitant (80 mg) 1 hour before induction of anaesthesia
Outcomes	PONV, side effects
Notes	Study status (completed), first posted (2015), missing information (anaesthesia regimen)

NCT02541019

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy, older than 60 years of age, ASA I to III, female
Interventions	Palonosetron (75 mcg) 1 minute before anaesthesia induction or ondansetron (4 mg) 1 minute before anaesthesia induction and 4 mg 3 times a day during 2 days after surgery
Outcomes	PONV, nausea, complete response, adverse events
Notes	Study status (completed), first posted (2015), missing information (outcome)

NCT02594241

Methods	Randomized controlled trial
Participants	Patients with ventral incisional hernia with horizontal fascial defect > 10 cm described at computed tomography scan or clinical assessment, planned elective open hernia repair, older than 18 years of age
Interventions	Methylprednisolone (125 mg) immediately after induction of general anaesthesia or saline (100 mL) 2 hours before surgery
Outcomes	Pain, nausea, vomiting, complications
Notes	Study status (unknown), first posted (2015), missing information (anaesthesia regimen)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT02711449

Methods	Randomized controlled trial
Participants	Patients having laparoscopy for suspected appendicitis, older than 18 years of age, ASA I to III
Interventions	Methylprednisolone (125 mg) approximately 30 minutes before skin incision or saline (0.9%) approximately 30 minutes before skin incision
Outcomes	Pain, side effects, PONV
Notes	Study status (completed), first posted (2016), missing information (anaesthesia regimen, outcome)

NCT02744495

Methods	Randomized controlled trial
Participants	Patients with non-emergent cardiac surgery, older than 18 years of age
Interventions	Betamethasone (4 mg) and/or droperidol (0.625 mg) immediately after cardiac surgery
Outcomes	PONV, pain, side effects, QTc interval
Notes	Study status (completed), first posted (2016), missing information (anaesthesia regimen)

NCT02744508

Methods	Randomized controlled trial
Participants	Patients undergoing minor orthopaedic surgery, 20 to 65 years of age
Interventions	Palonosetron or palonosetron and dexamethasone
Outcomes	PONV
Notes	Study status (completed), first posted (2016), missing information (anaesthesia regimen, time point of administration)

NCT02755116

Methods	Randomized controlled trial
Participants	Patients undergoing ambulatory surgery
Interventions	10 mg olanzapine or placebo
Outcomes	Nausea, vomiting
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized); if eligible, data will be included in next update of the review

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT02767882

Methods	Randomized controlled trial
Participants	Patients scheduled for elective primary unilateral total knee replacement, 18 to 80 years of age, ASA I to III, Chinese patients
Interventions	Dexamethasone (2 mL) or dexamethasone (4 mL) or saline (4 mL)
Outcomes	Pain
Notes	Study status (unknown), first posted (2016), missing information (anaesthesia regimen)

NCT02803788

Methods	Randomized controlled trial
Participants	Patients undergoing elective laparoscopic cholecystectomy, female, 20 to 40 years of age, ASA I and II
Interventions	Ondansetron (4 mg) and dexamethasone (8 mg) just before extubation or ramosetron (0.3 mg) just before extubation
Outcomes	Nausea, vomiting, adverse effect, pain
Notes	Study status (unknown), first posted (2016), missing information (anaesthesia regimen)

NCT02809378

Methods	Randomized controlled trial
Participants	Female patients undergoing thyroidectomy, ASA I or II, 20 to 60 years of age
Interventions	Palonosetron (0.075 mg) before anaesthesia induction or no treatment
Outcomes	PONV
Notes	Study identified after first search; data will be included in next update of the review

NCT02849483

Methods	Randomized controlled trial
Participants	Patients scheduled for gynaecological laparoscopic surgery, 20 to 70 years of age, ASA I and II
Interventions	Ramosetron or saline
Outcomes	Complications
Notes	Study status (recruiting), first posted (2016), missing information (anaesthesia regimen, outcome, time point of administration)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT02884180

Methods	Randomized controlled trial
Participants	Patients scheduled for unilateral, revision TKA: total and major partial revisions were included (i.e. revisions including femoral and/or tibial component(s)); older than 18 years of age; ASA I to III; BMI > 18 and < 45; women in the fertile age (i.e. until 1 year after menopause) must have negative urine human chorionic gonadotropin (HCG) pregnancy test
Interventions	Dexamethasone (24 mg) after start of anaesthesia or saline isotonic after start of anaesthesia
Outcomes	Pain, adverse events, nausea, vomiting, dizziness
Notes	Study status (recruiting), first posted (2016), missing information (anaesthesia regimen)

NCT02966041

Methods	Randomized controlled trial
Participants	Patients (elective and urgent) with cardiac surgery procedures requiring cardiopulmonary bypass, older than 19 years of age
Interventions	Ondansetron (4 mg) or saline (2 mL) at time of discontinuation of propofol infusion
Outcomes	PONV, rescue PONV medication, PON, POV, ventricular arrhythmias
Notes	Study status (completed), first posted (2016), missing information (anaesthesia regimen)

NCT02968082

Methods	Randomized controlled trial
Participants	Patients have hemi-facial spasm or trigeminal neuralgia, undergo microvascular decompression (MVD), understand study objectives and voluntarily consent to participation, 18 to 65 years of age, ASA I and II
Interventions	Scopolamine (1.5 mg) or placebo
Outcomes	Nausea
Notes	Study status (unknown), first posted (2016), missing information (anaesthesia regimen)

NCT03034733

Methods	Randomized controlled trial
Participants	Patients having primary total knee replacement surgery, ASA I to III, 18 to 90 years of age
Interventions	Dexamethasone (0.15 mg/kg) intraoperative, dexamethasone (0.25 mg/kg) intraoperative, saline (0.9%) intraoperative

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT03034733 *(Continued)*

Outcomes	Pain, nausea, vomiting, wound complication/infection
Notes	Study status (recruiting), first posted (2017), missing information (anaesthesia regimen)

NCT03094442

Methods	Randomized controlled trial
Participants	Patients scheduled for minimally invasive sacrocolpopexy with or without concomitant anti-incontinence procedure and with or without concomitant hysterectomy, ASA I and II, older than 18 years of age
Interventions	Dexamethasone (8 mg) administered at time of induction of general anaesthesia or normal saline 0.9%
Outcomes	Pain, PONV, side effects
Notes	Study status (recruiting), first posted (2017), missing information (anaesthesia regimen)

NCT03141645

Methods	Randomized controlled trial
Participants	Patients having elective laparoscopic cholecystectomy, 18 to 70 years of age, ASA I to III
Interventions	Ondansetron (8 mg) 15 minutes before finishing operation or placebo/no intervention or Ringer's lactate solution (10 mL/kg) 15 minutes before starting operation
Outcomes	PONV
Notes	Study status (recruiting), first posted (2017), missing information (anaesthesia regimen)

NCT03218553

Methods	Randomized controlled trial
Participants	Patients having major surgery (> 90 minutes and realized under general anaesthesia) of the abdomen, pelvis, thorax, face/neck; vascular surgery in a patient older than 65 years; or major surgery (> 90 minutes and realized under general anaesthesia) of the abdomen, pelvis, thorax, face/neck, vascular surgery in a patient older than 50 years; risk factor for cardiac or respiratory disease; medical history of smoke; renal impairment; active smoking; blood losses > 500 mL, emergency surgery, 50 to 90 years of age
Interventions	Dexamethasone (0.2 mg/kg at end of surgical procedure, second dose 0.2 mg/kg 24 hours after surgery) or placebo (at end of surgical procedure, second dose 24 hours after surgery)
Outcomes	Sepsis/infection
Notes	Study status (recruiting), first posted (2017), missing information (anaesthesia regimen, outcome)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT03278522

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic gynaecological surgery, age > 19 to 99 years, female
Interventions	Ramosetron (0.6 mg) at anaesthesia induction or ramosetron (0.6 mg) at end of surgery or placebo
Outcomes	QTc interval change
Notes	Study status (completed), first posted (2017), missing information (comparator)

NCT03338400

Methods	Randomized controlled trial
Participants	Patients undergoing outpatient vaginal prolapse surgery
Interventions	Dexamethasone or saline
Outcomes	Nausea, vomiting, quality of recovery
Notes	Study protocol identified in search update; missing information about anaesthesia details; if eligible, data will be included in next update of the review

NCT03403517

Methods	Randomized controlled trial
Participants	Patients undergoing open liver resection
Interventions	Methylprednisolone or dexamethasone
Outcomes	Postoperative complications
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized); if eligible, data will be included in next update of the review

NCT03409835

Methods	Randomized controlled trial
Participants	Patients undergoing gynaecological surgery
Interventions	Ramosetron or saline
Outcomes	Nausea, vomiting, pain, patient satisfaction
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized); if eligible, data will be included in next update of the review

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT03459248

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy
Interventions	Metoclopramide plus ondansetron or metoclopramide alone
Outcomes	PONV, patient satisfaction
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized, age); if eligible, data will be included in next update of the review

NCT03586817

Methods	Randomized controlled trial
Participants	Patients undergoing video-laparoscopic cholecystectomy
Interventions	Palonosetron or fosaprepitant
Outcomes	Complete response, nausea, vomiting
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized); if eligible, data will be included in next update of the review

NCT03631004

Methods	Randomized controlled trial
Participants	Patients undergoing medium and large surgeries in the thoracic or abdominal region (mastectomy, breast plastic surgery, hysterectomy, annexectomy, gynaecological pelvic surgery, colectomy, rectosigmoidectomy)
Interventions	Olanzapine or placebo
Outcomes	Nausea, vomiting, retching, side effects
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized); if eligible, data will be included in next update of the review

NCT03685032

Methods	Randomized controlled trial
Participants	Patients undergoing microvascular decompression surgery
Interventions	Dexamethasone, ondansetron, or saline
Outcomes	PONV, pain

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT03685032 *(Continued)*

Notes	Study protocol identified in search update; missing information about anaesthesia details; if eligible, data will be included in next update of the review

NCT03874936

Methods	Randomized controlled trial
Participants	Patients undergoing operation for hip dysplasia
Interventions	Dexamethasone or saline
Outcomes	Pain, morphine consumption, nausea, vomiting, side effects
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized); if eligible, data will be included in next update of the review

NCT03901768

Methods	Randomized controlled trial
Participants	Patients undergoing total knee surgery
Interventions	Dexamethasone or placebo
Outcomes	Pain
Notes	Study protocol identified in search update; missing information about anaesthesia details; if eligible, data will be included in next update of the review

NCT04013386

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic sleeve gastrectomy
Interventions	Dexamethasone plus aprepitant or dexamethasone alone
Outcomes	PONV
Notes	Study protocol identified in search update; missing information about anaesthesia details; if eligible, data will be included in next update of the review

NCT04027751

Methods	Randomized controlled trial
Participants	Patients undergoing elective non-cardiac surgery

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT04027751 *(Continued)*

Interventions	Tropisetron or placebo
Outcomes	Delirium, nausea, vomiting, side effects
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized); if eligible, data will be included in next update of the review

NCT04195204

Methods	Randomized controlled trial
Participants	Patients undergoing cardiac surgery
Interventions	Tropisetron or placebo
Outcomes	Delirium, nausea, vomiting, side effects
Notes	Study protocol identified in search update; missing information about anaesthesia details (standardized); if eligible, data will be included in next update of the review

PACTR201510001174606

Methods	Randomized controlled trial
Participants	Patients are candidates for laparoscopic cholecystectomy, 20 to 70 years of age
Interventions	Dexamethasone or placebo
Outcomes	PONV
Notes	Study status (NA), first posted (2015), missing information (anaesthesia regimen, time point of administration)

PACTR201707002398224

Methods	Randomized controlled trial
Participants	Patients coming for elective breast surgery, ASA I and II, 18 to 70 years of age, female
Interventions	Dexamethasone or saline
Outcomes	PONV, pain
Notes	Study status (completed), first posted (2017), missing information (anaesthesia regimen, time point of administration)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Pandit 1986

Methods	Randomized controlled trial
Participants	Adult female patients undergoing laparoscopic examination or laparoscopic tubal cauterization, ASA I and II
Interventions	Study phase 1: cimetidine 300 mg orally 2 hours before operation with metoclopramide 10 mg IV about 15 minutes before induction or cimetidine 300 mg orally 2 hours before operation with placebo IV about 15 minutes before induction or placebo orally 2 hours before operation with metoclopramide 10 mg IV about 15 minutes before induction or placebo orally 2 hours before operation with placebo IV 15 minutes before induction Study phase 2: cimetidine 300 mg orally approximately 160 minutes beforehand, followed by metoclopramide 10 mg or 20 mg or placebo about 30 minutes before induction
Outcomes	PONV, pH of gastric juice, residual gastric volume
Notes	Missing information about time point of outcome assessment; no contact details available

Park 2018

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic colectomy for colorectal cancer
Interventions	0.3 mg ramosetron i.v. or saline (placebo)
Outcomes	PONV, pain, total amount of patient-controlled analgesia used, recovery of bowel function
Notes	Study identified in search update; data will be included in next update of the review

Paul 1985

Methods	Randomized controlled trial
Participants	Adult patients undergoing elective surgery
Interventions	Metoclopramide 10 mg IV or no treatment 5 to 10 minutes before end of anaesthesia
Outcomes	Vomiting, side effects
Notes	Missing information about study design; no contact details available

Paul 2018

Methods	Randomized controlled trial
Participants	Patients undergoing ear or nose surgery
Interventions	0.075 mg palonosetron i.v. or 8 mg dexamethasone i.v.

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Paul 2018 *(Continued)*

Outcomes	PONV
Notes	Study identified in search update; data will be included in next update of the review

Rajnikant 2019

Methods	Randomized controlled trial
Participants	Patients undergoing ear or nose surgery
Interventions	0.075 mg palonosetron i.v. or 8 mg dexamethasone i.v.
Outcomes	PONV
Notes	Study identified in search update; data will be included in next update of the review

RBR-4mjv6r

Methods	Randomized controlled trial
Participants	Patients undergoing elective laparoscopic cholecystectomy, 20 to 65 years of age, ASA I and II
Interventions	Palonosetron (0.075 mg) before anaesthesia induction or ondansetron (8 mg) before anaesthesia induction and 8 and 16 hours after surgery
Outcomes	PONV
Notes	Study status (recruiting), first posted (2017), missing information (anaesthesia regimen, outcome)

RBR-55mp5z

Methods	Randomized controlled trial
Participants	Patients undergoing elective laparoscopic gastroplasty, 20 to 65 years of age, ASA I and II, BMI ≥ 35 kg/m^2
Interventions	Palonosetron (0.075 mg) before anaesthesia induction or ondansetron (8 mg) before anaesthesia induction and 8 and 16 hours after surgery
Outcomes	PONV
Notes	Study status (recruiting), first posted (2016), missing information (anaesthesia regimen, outcome)

Reddy 2019

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystetomy

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Reddy 2019 *(Continued)*

Interventions	Palonosetron i.v. or ramosetron i.v.
Outcomes	PONV, adverse effects
Notes	Study identified in search update; data will be included in next update of the review

Roy 1977

Methods	Randomized controlled trial
Participants	NA
Interventions	Prochlorperazine
Outcomes	Postoperative sickness
Notes	No full text available

Rudra 1987

Methods	Randomized controlled trial
Participants	Female patients undergoing tubal ligation
Interventions	Metoclopramide 10 mg IM or normal saline IM 30 minutes before cessation of anaesthesia
Outcomes	PONV, dizziness, blood pressure, pulse, emergence delirium, extrapyramidal manifestation
Notes	Missing information about range of age and study design; no contact details available

Rust 1995

Methods	Randomized controlled trial
Participants	Female patients undergoing major gynaecological surgery
Interventions	Ondansetron 4 mg IV or metoclopramide 10 mg IV or placebo immediately before induction of anaesthesia
Outcomes	PONV
Notes	Missing information about anaesthesia regimen and range of age; no contact details available

Sajedi 2008

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sajedi 2008 *(Continued)*

Participants	Patients undergoing elective orthopaedic surgery, 18 to 65 years of age, weight 50 to 70 kg, ASA I and II
Interventions	Granisetron 40 µg/kg IV or meperidine 0.4 mg/kg IV or saline 0.9% IV at end of surgery
Outcomes	Post-anaesthesia shivering, blood pressure, heart rate, core temperature, sedation, nausea, vomiting, respiratory depression
Notes	Mail sent on the 10th of July 2018; reason for request was missing information about time point for assessment of postoperative vomiting; no response received

Schettini 1989

Methods	Randomized controlled trial
Participants	Participants between 18 and 40 years of age
Interventions	L-sulpiride 50 mg or l-sulpiride 100 mg or droperidol 5 mg or control
Outcomes	Vomiting, prolactin secretion, headache, visual disturbance
Notes	Missing information about anaesthesia regimen; no contact details available

Schietroma 2010

Methods	Randomized controlled trial
Participants	Adult participants undergoing laparoscopic Nissen fundoplication
Interventions	Dexamethasone 8 mg plus promethazine 0.5 mg/kg IV before induction or promethazine 0.5 mg/kg IV alone before induction
Outcomes	Postoperative wound infection
Notes	Several clinical studies from the study author (Mario Schietroma) were retracted or were listed in the Retraction Watch Database

Schietroma 2013

Methods	Randomized controlled trial
Participants	Adult participants undergoing total thyroidectomy or total lobectomy
Interventions	Dexamethasone 8 mg plus promethazine 0.5 mg/kg IV before induction or promethazine 0.5 mg/kg IV alone before induction
Outcomes	Postoperative wound infection
Notes	Retracted study; listed in the Retraction Watch Database

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Schnaider 2008

Methods	Randomized controlled trial
Participants	Female patients undergoing total abdominal hysterectomy with adnexectomy under general anaesthesia with epidural block, 20 to 50 years of age, ASA I and II
Interventions	Metoclopramide 20 mg IV or dexamethasone 8 mg IV or droperidol 1.25 mg IV or ondansetron 8 mg IV or dexamethasone 8 mg and ondansetron 4 mg IV or droperidol 1.25 mg and ondansetron 4 mg IV or dexamethasone 8 mg and droperidol 0.625 mg and ondansetron 4 mg IV after venipuncture but before epidural puncture
Outcomes	PONV
Notes	Mail sent on 10th of July 2018; reason for request was missing information about study design; no response received

Shah 2011

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy, 18 to 60 years of age, ASA I and II
Interventions	Dexamethasone 8 mg IV or saline IV 2 hours before the operation
Outcomes	PONV, pain
Notes	Mail sent on 20th of March 2018 and again on 31st of July 2018; reason for request was missing information about type of anaesthesia; no response received

Sharma 2019

Methods	Randomized controlled trial
Participants	Patients undergoing middle ear surgery
Interventions	Palonosetron i.v. or ondansetron i.v.
Outcomes	PONV, nausea, vomiting, QT prolongation
Notes	Study identified in search update; data will be included in next update of the review

Shetty 2015

Methods	Randomized controlled trial
Participants	Patients undergoing elective middle ear surgery, 15 to 60 years of age, ASA I and II, scheduled to be hospitalized for 36 hours after surgery
Interventions	Ondansetron 4 mg IV or ramosetron 0.3 mg IV after the operation

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Shetty 2015 *(Continued)*

Outcomes	PONV, headache, drowsiness, dizziness, itching
Notes	Mail sent on 21st of March 2018 and again on 31st of July 2018; reason for request was missing information about time point af administration of study drugs and type of anaesthesia; no response received

Simogai 2016

Methods	Randomized controlled trial
Participants	NA
Interventions	Dexamethasone or combined diphenhydramine and diprophylline
Outcomes	PONV
Notes	No full text available

Singh 2008

Methods	Randomized controlled trial
Participants	Adult patients undergoing laparoscopic cholecystectomy
Interventions	Dexamethasone 10 mg IV (3 mL) or normal saline (3 mL)
Outcomes	PONV
Notes	No full text available

Singh 2011

Methods	Randomized controlled trial
Participants	Patients undergoing elective surgery under general anaesthesia, 21 to 50 years of age, ASA I and II
Interventions	Granisetron 2 mg IV or magnesium sulfate 2.48 mmol or nitroglycerine 200 µg or normal saline before injection of propofol
Outcomes	Pain
Notes	Mail sent on 18th of January; reason for request was missing information about time point of assessment of nausea; no response received

Sirajuddin 2014

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Sirajuddin 2014 *(Continued)*

Participants	Female patients undergoing breast surgery
Interventions	Metoclopramide (0.15 mg/kg) alone or metoclopramide (0.15 mg/kg) with dimenhydrinate (1 mg/kg) after induction
Outcomes	PONV
Notes	No full text available

Snow 1965

Methods	Randomized controlled trial
Participants	Patients undergoing elective surgery for retinal detachment
Interventions	Hydroxyzine 50 mg IM or prochlorperazine 5 mg IM or no treatment upon arrival in the recovery room
Outcomes	PONV, restlessness
Notes	Missing information about mean age and administration of study drugs before onset of PONV; no contact details available

Srivastava 2012

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy under general anaesthesia, 20 to 60 years of age, ASA I and II
Interventions	Metoclopramide 10 mg IV or ondansetron 4 mg IV or granisetron 3 mg IV before induction of anaesthesia
Outcomes	PONV, pain, patient satisfaction, adverse effects
Notes	No full text available

Stefanov 2005

Methods	Randomized controlled trial
Participants	Female patients undergoing laparoscopic cholecystectomy
Interventions	Dexamethasone or placebo
Outcomes	Vomiting
Notes	No full text available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Tahir 2018

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic abdominal surgery
Interventions	Palonosetron i.v. or granisetron i.v.
Outcomes	PONV
Notes	Study identified in search update; data will be included in next update of the review

Tantawy 2008

Methods	Randomized controlled trial
Participants	Patients undergoing major pelvic oncological surgery
Interventions	Epidural dexamethasone 4 mg with morphine 4 mg or morphine 4 mg alone
Outcomes	Pain, morphine-related side effects
Notes	No full text available

Thongrong 2018

Methods	Randomized controlled trial
Participants	Patients undergoing microvascular decompression surgery
Interventions	Dexamethasone i.v. or ondansetron i.v.
Outcomes	PONV
Notes	Study identified in search update; data will be included in next update of the review

Tokat 1994

Methods	Randomized controlled trial
Participants	Female patients undergoing gynaecological surgery, ASA I and II
Interventions	Ondansetron 4 mg IV or placebo 30 minutes before surgery and 8 hours after surgery
Outcomes	PONV, blood pressure, pulse
Notes	Missing information about randomisation; no contact details available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Tolksdorf 1985

Methods	Randomized controlled trial
Participants	Female patients undergoing minor gynaecological surgery, 21 to 77 years of age
Interventions	Transdermal scopolamine or identical placebo patch
Outcomes	PONV
Notes	Missing information about randomization; no contact details available

Top 1996

Methods	Randomized controlled trial
Participants	NA
Interventions	Ondansetron 4 mg or ondansetron 4 mg with dexamethasone 8 mg 5 minutes before induction
Outcomes	PONV, sleep manner
Notes	Missing information about study design; no contact details available

Tornetta 1969

Methods	Randomized controlled trial
Participants	Adult patients undergoing elective surgery
Interventions	Study part 1: metoclopramide 10 mg IM or placebo IM at end of operation Study part 2: metoclopramide 20 mg IV or metoclopramide 30 mg IV or metoclopramide 50 mg IV before emergence from anaesthesia Study part 3: metoclopramide 20 mg IM or prochlorperazine 10 mg IM or placebo before emergence from anaesthesia
Outcomes	PONV, blood pressure, pulse, time of emergence
Notes	Missing information about anaesthesia regimen; no contact details available

Tuhanioglu 2018

Methods	Randomized controlled trial
Participants	Patients undergoing tonsillectomy
Interventions	Dexamethasone or saline
Outcomes	Pain, vomiting

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Tuhanioglu 2018 *(Continued)*

Notes	Study identified in search update; data will be included in next update of the review

Tuncer 2002

Methods	Randomized controlled trial
Participants	Patients undergoing major orthopaedic surgery with at least 24 hours bed rest, over 18 years of age, ASA I and II
Interventions	Dexamethasone 150 µg/kg IV or normal saline IV before the start of PCA, which was started in the recovery room
Outcomes	PONV, pain
Notes	Mail sent on 21st of March 2018 and again on 31st of July 2018; reason for request was missing information about randomization and time point of administration of study drugs; no response received

Tur 1994

Methods	Randomized controlled trial
Participants	Patients undergoing gynaecological, ear nose and throat, or ophthalmic surgery, 16 to 75 years of age
Interventions	Oral ondansetron 4 mg and 1 mg/kg pethidine IM or only pethidine 1 mg/kg IM for premedication
Outcomes	PONV
Notes	Missing information about study design; no contact details available

Tur 1995

Methods	Randomized controlled trial
Participants	Adult patients, 17 to 65 years of age
Interventions	Oral ondansetron in doses of 4 mg or 8 mg or 16 mg or no treatment preoperatively
Outcomes	Postoperative vomiting
Notes	Missing information about study design; no contact details available

Turan 2006

Methods	Randomized controlled trial

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Turan 2006 *(Continued)*

Participants	Adult patients undergoing elective surgery under general anaesthesia that was expected to last at least 1 hour, at least 2 risk factors
Interventions	Intraoperative 80% oxygen or 30% oxygen and also ondansetron 4 mg or not, dexamethasone 4 mg or not, droperidol 1.25 mg or not
Outcomes	PONV
Notes	Mail sent on 18th of January 2018; reason for request was missing information about outcome data; no response received

Usmani 2003

Methods	Randomized controlled trial
Participants	Patients undergoing elective middle ear surgery, ASA I and II
Interventions	Ondansetron 0.1 mg/kg IV or dexamethasone 0.15 mg/kg IV or ondansetron 0.1 mg/ kg IV with dexamethasone 0.15 mg/kg IV 10 minutes before induction of anaesthesia
Outcomes	PONV, headache, dizziness, erythema at injection site, perineal itching
Notes	Missing information about range of age; no contact details available

Ventriglia 1993

Methods	Randomized controlled trial
Participants	Patients undergoing abdominal surgery
Interventions	Ondansetron 4 mg IV or physiological solution at the moment of induction
Outcomes	PONV
Notes	No full text available

Vimlati 2002

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic cholecystectomy
Interventions	Ondansetron 4 mg IV before starting anaesthesia or ondansetron 4 mg IV at end of operation or control
Outcomes	PONV
Notes	Missing information about range of age; no contact details available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Viriyaroj 2015

Methods	Randomized controlled trial
Participants	Patients undergoing elective laparoscopic cholecystectomy
Interventions	Dexamethasone 8 mg IV 60 to 90 minutes before surgery or normal saline 60 to 90 minutes before surgery
Outcomes	Pain, PONV, analgesic consumption, antiemetic requirement, erythrocyte sedimentation, C-reactive protein
Notes	No full text available

Wang 2002

Methods	Randomized controlled trial
Participants	Patients undergoing elective surgery
Interventions	Ondansetron 8 mg or tropisetron 3 mg or ondansetron 8 mg plus dexamethasone 10 mg or tropisetron 3 mg plus dexamethasone 10 mg
Outcomes	PONV, wound healing
Notes	Mail sent on 20th of March 2018; reason for request was missing information about age range, type of anaesthesia, time point for assessment of PONV; mail could not be delivered

Wang 2020

Methods	Randomized controlled trial
Participants	Patients undergoing cardiac surgery
Interventions	Ondansetron or placebo
Outcomes	PONV, headache, arrhythmia
Notes	Study identified in search update; data will be included in next update of the review

Winning 1977

Methods	Randomized controlled trial
Participants	Patients undergoing minor gynaecological or urological surgery, average age of 32.7 years
Interventions	Droperidol 5 mg IM or diphenidol 40 mg IM or saline IM 1 hour before anaesthesia
Outcomes	PONV, giddiness, drowsiness, weakness, confusion
Notes	Missing information about study design; no contact details available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Wittayapairoj 2017

Methods	Randomized controlled trial
Participants	Patients undergoing lumbar spine surgery
Interventions	0.2 mg/kg dexamethasone or normal saline
Outcomes	Morphine consumption, pain, adverse events
Notes	Study identified in search update; data will be included in next update of the review

Wu 1998

Methods	Randomized controlled trial
Participants	Patients undergoing gynaecological surgery
Interventions	Droperidol epidural or droperidol intravenous
Outcomes	PONV
Notes	No full text available

Wu 2018

Methods	Randomized controlled trial
Participants	Patients undergoing total knee arthroplasty
Interventions	Dexamethasone or normal saline
Outcomes	Pain, postoperative complications
Notes	Study identified in search update; data will be included in next update of the review

Yan 2019

Methods	Randomized controlled trial
Participants	Patients undergoing laparoscopic radical resection
Interventions	Palonosetron or tropisetron
Outcomes	Abdominal distension, nausea, vomiting, ECG, blood oxygen, heart rate, respiratory frequency, mental and neurological symptoms
Notes	Study identified in search update; needs translation (Chinese)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Yao 2002

Methods	Randomized controlled trial
Participants	Female patients undergoing hysterectomy, ASA I and II
Interventions	Epidural saline or epidural 2% lidocaine 10 mL combined with 2.5 µg/mL fentanyl 30 minutes before skin incision followed by 0.125% ropivacaine and 2 µg/mL fentanyl infusion at 9 mL/h to the end of surgery or epidural 2% lidocaine 10 mL combined with 2.5 µg/mL fentanyl and 0.15 mg/mL droperidol 30 minutes before incision followed by 0.125% ropivacaine and 2 µg/mL fentanyl infusion at 9 mL/h to end of surgery
Outcomes	Pain, nausea, pruritus, motor block
Notes	No full text available

Yoo 2018

Methods	Randomized controlled trial
Participants	Patients undergoing elective surgery under general anaesthesia
Interventions	Aprepitant plus palonosetron or palonosteron alone
Outcomes	Nausea, vomiting
Notes	Study identified in search update; data will be included in next update of the review

Zafar 2018

Methods	Randomized controlled trial
Participants	Patients undergoing open appendectomy
Interventions	Dexamethasone plus dimenhydrinate or dimenhydrinate alone
Outcomes	Nausea, vomiting
Notes	Study identified in search update; data will be included in next update of the review

Zarate 2001

Methods	Randomized controlled trial
Participants	Patients undergoing ambulatory ear, nose, and throat surgery
Interventions	Metoclopramide
Outcomes	PONV
Notes	No full text available

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Zhang 2016

Methods	Randomized controlled trial
Participants	Patients undergoing thyroid surgery
Interventions	Dexamethasone 0.1 mg/kg or same volume of saline at induction of anaesthesia
Outcomes	Pain, PONV
Notes	No full text available

Abbreviations: ASA = American Society of Anesthesiologists physical status classification system; BMI = body mass index; IM = intramuscular; IMF = intermaxillary fixation; IV = intravenous; NA = not available; PONV = postoperative nausea and vomiting; IV = intravenous; TIVA = total intravenous anaesthesia.

DATA AND ANALYSES

Comparison 1. Amisulpride versus placebo

Outcome or subgroup title	No. of studies	No. of participants	Statistical method	Effect size
1.1 Vomiting within 0 to 24 hours	2	841	Risk Ratio (IV, Random, 95% CI)	0.71 [0.52, 0.98]
1.1.1 Low dose	1	76	Risk Ratio (IV, Random, 95% CI)	0.83 [0.38, 1.80]
1.1.2 Recommended dose	2	694	Risk Ratio (IV, Random, 95% CI)	0.69 [0.38, 1.25]
1.1.3 High dose	1	71	Risk Ratio (IV, Random, 95% CI)	0.44 [0.19, 1.00]
1.2 Serious adverse events	2	904	Risk Ratio (IV, Random, 95% CI)	0.83 [0.38, 1.85]
1.2.1 Low dose	1	76	Risk Ratio (IV, Random, 95% CI)	0.97 [0.04, 22.74]
1.2.2 Recommended dose	2	757	Risk Ratio (IV, Random, 95% CI)	0.62 [0.11, 3.43]
1.2.3 High dose	1	71	Risk Ratio (IV, Random, 95% CI)	0.68 [0.07, 7.05]
1.3 Any adverse event	2	904	Risk Ratio (IV, Random, 95% CI)	0.97 [0.90, 1.06]
1.3.1 Low dose	1	76	Risk Ratio (IV, Random, 95% CI)	0.95 [0.75, 1.22]
1.3.2 Recommended dose	2	757	Risk Ratio (IV, Random, 95% CI)	0.98 [0.90, 1.08]
1.3.3 High dose	1	71	Risk Ratio (IV, Random, 95% CI)	0.93 [0.72, 1.20]
1.4 Headache	2	904	Risk Ratio (IV, Random, 95% CI)	1.56 [0.80, 3.08]

ADDITIONAL TABLES

Table 1. Recommended, low, and high doses of antiemetic drugs

Drug	Dose*	Cut-off (lower, upper limit)**	Low dose	Recommended dose	High dose
Amisulpride	5 mg to 10 mg IV	NR	< 5 mg	5 mg to 10 mg	> 10 mg
Aprepitant	40 mg per os	NR	< 40 mg	40 mg	> 40 mg
Casopitant	150 mg per os	NR	< 150 mg	150 mg	> 150 mg
Dexamethasone	4 mg to 5 mg IV	NR	< 4 mg	4 mg to 5 mg	> 5 mg
Dimenhydrinate	1 mg/kg IV	NR	< 1 mg/kg	1 mg/kg	> 1 mg/kg
Dolasetron	12.5 mg IV	NR	< 12.5 mg	12.5 mg	> 12.5 mg
Droperidol	0.625 mg to 1.25 mg IV	See FDA[1] 2.5 mg IV	< 0.625 mg	0.625 mg to 1.25 mg	> 1.25 mg
Fosaprepitant	NR	NR	NR	NR	NR

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Table 1. Recommended, low, and high doses of antiemetic drugs *(Continued)*

Granisetron	0.35 mg to 3 mg IV	NR	< 0.35 mg	0.35 mg to 3 mg	> 3 mg
Haloperidol	0.5 mg to < 2 mg IM/IV	See FDA < 2 mg	< 0.5 mg	0.5 mg to < 2 mg	2 mg (cut-off)
Meclizine	50 mg per os	NR	< 50 mg	50 mg	> 50 mg
Methylprednisolone	40 mg IV	NR	< 40 mg	40 mg	> 40 mg
Metoclopramide	25 mg to 50 mg IV	10 mg[(2)]	< 25 mg (10 mg cut-off)	25 mg to 50 mg	> 50 mg
Ondansetron	4 mg IV, 8 mg ODT	NR for PONV (32 mg for other[(3)])	< 4 mg IV, < 8 mg ODT	4 mg IV, 8 mg ODT	> 4 mg IV, > 8 mg ODT, (32 mg cut-off)
Palonosetron	0.075 mg IV	NR	< 0.075 mg	0.075 mg	> 0.075 mg
Perphenazine	5 mg IV	NR	< 5 mg	5 mg	> 5 mg
Promethazine	6.25 mg to 12.5 mg IV	NR	< 6.25 mg	6.25 mg to 12.5 mg	> 12.5 mg
Ramosetron	0.3 mg IV	NR	< 0.3 mg	0.3 mg	> 0.3 mg
Rolapitant	70 mg to 200 mg per os	NR	< 70 mg	70 mg to 200 mg	> 200 mg
Scopolamine	Transdermal patch	NR	NA	NA	NA
Tropisetron	2 mg IV	NR	< 2 mg	2 mg	> 2 mg

* Recommended doses are based on Gan 2014; for amisulpride, we used data from a dose-finding study (Kranke 2013).
** Cut-off limits are based on those reported in Gan 2014.
(1) FDA black box warning.
(2) Metoclopramide at a dose of 10 mg is not effective in reducing the incidence of PONV.
(3) 32 mg single IV dose for chemotherapy-induced nausea (FDA warning).
Abbreviations: IM = intramuscular; IV = intravenous; NA = not applicable; NR = not reported; ODT = orally disintegration tablets; per os = per oral.

Table 3. Most common dosages, routes, and time points of administration of single drugs of direct interest (primary outcome: vomiting)

Drug	Dose	Dose category	Route	Timing
Amisulpride	5 to 10 mg	rec	IV	at induction of AN
Aprepitant	40 mg	rec	PO	before surgery
Casopitant	150 mg	rec	PO	before surgery
Dexamethasone*	4 to 5 mg	rec	IV	at induction of AN
Dimenhydrinate	< 1 mg/kg	low	IV/IM	at induction of AN/before surgery
Dolasetron	12.5 mg	rec	IV	end of surgery
Droperidol	0.625 to 1.25 mg	rec	IV	at induction of AN
Fosaprepitant	150 mg	NA	IV	at induction of AN
Granisetron	0.35 to 3 mg	rec	IV	all time points
Haloperidol	0.5 to < 2 mg	rec	IV	at induction of AN
Metoclopramide	25 to 50 mg	low	IV	at induction of AN
Ondansetron (IV)	4 mg	rec	IV	at induction of AN
Ondansetron (PO)	8 mg	rec	PO	before surgery
Palonosetron	0.075 mg	rec	IV	at induction of AN
Promethazine**	< 6.25 mg	low	IV	at induction of AN
Ramosetron (IV)	0.3 mg	rec	IV	end of surgery
Rolapitant	70 to 200 mg	rec	PO	before surgery
Scopolamine	1.5 mg	NA	TD	before surgery
Tropisetron (IV)*	2 mg	rec	IV	at induction of AN

The table reported the most commonly used doses, routes, and time points of administration of drugs of direct interest for vomiting.
*Most of the studies investigated high doses, but recommended were also effective.
**Not used in any of the included studies with recommended dose.
Abbreviations: AN = anaesthesia; IM = intramuscular; IV = intravenous; NA = not applicable; PO = per oral; rec = recommended; TD = transdermal.

Appendix 4. Critical appraisal form

Author (year)			
Journal			
Title			
Risk of bias assessment (with quotes and/or statement)	***High risk of bias***	***Low risk of bias***	***Unclear risk of bias***
Random sequence generation (selection bias)			
State here the method used to generate the sequence			
Allocation concealment (selection bias)			
State here the method used to conceal allocation			
Blinding of participants and personnel (performance bias)			
Persons responsible for participants' care			
Participants			
Blinding of outcome assessment (detection bias)			
Outcome assessor			
Incomplete outcome data (attrition bias)			
Adequate, if dropout rate ≤ 15% and balanced between arms and reasons for missing values reported, and unrelated to the analysed outcome (data analysis described and imputation methods correct)			
Selective reporting (reporting bias)			
Adequate, if a prospectively registered study protocol is available and all pre-defined primary and secondary outcomes are also reported in the published study			
Other bias			
Other sources of bias (e.g. imbalance in baseline characteristics between study's arms)			

Appendix 5. Criteria for GRADEing the quality of evidence

The certainty of the evidence was assessed by two independent reviewers for the following domains and according to the following criteria:

Within-study risk of bias (study limitations): the contribution matrix was used to approximate the contribution of each piece of study to the NMA of relative treatment effects (Papakonstantinou 2018; Salanti 2014). A combination of study contributions with study risk of bias assessments (high, unclear, and low risk of bias) was used to evaluate study limitations for each NMA of relative treatment effect. We have assessed the quality level that contributed most to the NMA of treatment effect (majority RoB). In addition, we have compared the results of the NMA including all studies (primary analysis) with those obtained when only low risk of bias studies were included (sensitivity

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

analysis). If the clinical impact between the primary and the sensitivity NMA of treatment effect with respect to the range of equivalence does not differ (location of point estimate and 95% CI), no concern due to study limitations has been assumed.

Across-studies bias (publication bias): the risk of across-studies bias was investigated on the comparison level and only when a sufficient number of studies per direct comparison was available. For pair-wise comparisons with 10 or more relevant studies, we investigated risk of bias across studies using funnel plots and contour-enhanced funnel plots. In addition, we performed exploratory analyses (e.g. Rücker's arcsine test for dichotomous data, trim and fill sensitivity meta-analysis) to further investigate funnel plot asymmetry. Based on these empirical examinations, we assumed two possible descriptions for across-studies bias: undetected or suspected.

Indirectness: the domain indirectness refers to the relevance of the included studies to the research question. Among all reported studies, study populations, interventions, outcomes, and study settings matched the inclusion criteria of the current systematic review. Thus, we concluded that there is no indirectness in any of the studies included in the current review.

Imprecision: the 95% confidence interval expressed the uncertainty of the relative NMA treatment effects. Imprecise treatment effects with a wide confidence interval may be associated with high uncertainty regarding the clinical decision. We considered the range of treatment effects included in the confidence interval and compared it with the respective range of equivalence. The inclusion of different clinical implications in the confidence interval indicates an imprecise NMA treatment effect, and down-rating for imprecision was required (Nikolakopoulou 2019).

Heterogeneity: we measured heterogeneity using the 95% prediction interval, which indicates where the true effect of a future study is expected to lie (Riley 2011). Similarly to imprecision, of highest importance for assessing NMA treatment effects with respect to heterogeneity is whether a clinical decision is substantially influenced (Nikolakopoulou 2019). We evaluated compatibility between confidence and prediction intervals in terms of the range of equivalence for the assessment of heterogeneity.

If heterogeneity was present, we investigated "dose of the intervention" as a potential effect modifier in a subgroup network meta-analysis. Different clinical decisions between NMA treatment effects of low, recommended, and high doses with respect to the range of equivalence were included in the final judgement on heterogeneity.

Incoherence: disagreement between direct and indirect evidence is termed incoherence. It cannot be tested in cases where only direct or indirect evidence exists. However, if only indirect evidence is present, there is always some concern, and we downgraded the comparison for incoherence (Nikolakopoulou 2019). In cases where more than 90% of the information comes from direct evidence, we assumed that incoherence was not a concern (Salanti 2017).

In other cases, we used two ways of judging incoherence. First, we used a local test (ratio of risk ratios (direct versus indirect), test for disagreement) to measure inconsistency. Because we recognized the low power of this test for inconsistency, as already described by others, we considered the implication of incoherence for clinical decisions as an alternative (Nikolakopoulou 2019). Thus, we compared the clinical interpretation of confidence intervals of direct and indirect effect estimates with respect to the range of equivalence (Nikolakopoulou 2019). If direct and indirect estimates (95% CIs) were incoherent, we assessed whether both estimates contribute importantly to the NMA treatment effect (Brignardello-Petersen 2019). The proportions of direct and indirect contributions to the NMA treatment effect were calculated using König's method provided by the R command netsplit in the R package netmeta. If direct and indirect estimates contributed in a way comparable to 30% to 70% contribution to the NMA treatment effect, and if 95% CIs of both estimates were different (incoherent) with respect to the range of equivalence, down-rating for incoherence was required. If there was a dominant estimate (> 70% contribution) and the 95% CI was similar to the 95% CI of the NMA estimate, no down-rating for incoherence was performed.

Summarizing judgements across the six domains: we considered our judgements on separate domains in conjunction rather than in isolation. We paid particular attention not to downgrade twice for the same aspect (Nikolakopoulou 2019). Salanti et al described the following overlapping domains: indirectness – incoherence, heterogeneity – incoherence, heterogeneity – imprecision, and heterogeneity – publication bias (Nikolakopoulou 2019). For overlapping domains, we downgraded only once.

Appendix 6. Code (abbreviations) of interventions

Code (abbreviations) of interventions

5-HT3 receptor antagonists:

azas = azasetron

dola = dolasetron

gran = granisetron

onda = ondansetron

palo = palonosetron (rs-25259)

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

ramo = ramosetron

trop = tropisetron

D2 receptor antagonists:

aliz = alizapride

amis = amisulpride (APD421)

busp = buspirone

chlo = chlorpromazine

domp = domperidone

drop = droperidol

halo = haloperidol

levo = levomepromazine

meto = metoclopramide

olan = olanzapine

perp = perphenazine

proc = prochlorperazine

sulp = l-sulpiride

thie = thiethylperazine

trbe = trimethobenzamide

NK1 receptor antagonists:

apre = aprepitant

caso = casopitant

cp12 = cp-122,721

fosa = fosaprepitant

rola = rolapitant

vest = vestipitant

Corticosteroids:

dexa = dexamethasone

beta = betamethasone

meth = methylprednisolone

pred = prednisolone

Antihistamines (H1 receptor antagonists):

benz = benzquinamide

ceti = cetirizine

cycl = cylizine

dime = dimenhydrinate/ diphenhydramine

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

dixy = dixyrazine

doxy = doxylamin/ diclectin

mecl = meclizine

prom = promethazine

Anticholinergics:

diph = diphenidol

oxyb = oxybutynin

pene = penehyclidine

scop = scopalamine (transdermal scopolamine, hyoscine)

Interpreting data: SW, NP, GR, DR, IB, MS, PKi, LE, PKr, TS.

Making statistical inferences: SW, GR, NP.

Writing the review: SW, NP, GR, LE, MS, DR, PKr.

Securing funding for the review: SW, PKr.

Serving as guarantor for the review (one author): PKr.

Taking responsibility for reading and checking the review before submission: SW, GR, LE, NP, HH, OJ, DM, MR, MS, DR, IB, AH, TS, PKi, PKr.

DECLARATIONS OF INTEREST

General note: our review team included several experts in the field (NLP, DR, MSS, PKi, LHJE, AH, TS, PKr). Review authors (LHJE, PKr) who were involved in the conduct of studies related to the current review did not assess the relevant studies for inclusion or exclusion and were not allowed to extract data or critically appraise the quality of the relevant studies.

Stephanie Weibel has no conflict of interest regarding the topic of this review. Stephanie Weibel is an academic researcher. She has received personal payments for consultancies and lecture fees from Genelux Corporation, San Diego, California, USA (ended March 2014). Genelux Corporation does not produce any products for the intervention of interest in this review. She was involved in the conduct of phase 3 clinical trials related to the current review ("Amisulpride (APD421)" (NCT02646566 NCT02449291 Kranke 2018), and she was involved in a meta-analysis on the incidence of postoperative nausea and vomiting that was published recently (Schaefer 2016). She received funding through a one-time payment from B. Braun-Stiftung, Melsungen, Germany. The B. Braun-Stiftung is an independent and non-profit foundation. She has received lecture fees (topic: systematic reviews and meta-analyses) from the University of Marburg (2017, 2020).

Gerta Rücker is employed as a statistician at the Institute of Medical Biometry and Statistics of the Medical Center at the University of Freiburg. She received payment for a one-day course on statistical methods in meta-analysis from the Grünenthal Group, Aachen, Germany.

Nathan L Pace has no conflict of interest regarding the topic of this review. Nathan L Pace is a non-practising anaesthetist and statistician faculty member of the University of Utah, receives no private practice income, and has no commercial relationships. He has received payment for development of educational presentations (Barash, Cullen, Stoelting, CLINICAL ANESTHESIA, 8th edition) and has provided consultancy (St Marks Hospital, Salt Lake City, Utah, USA) on topics unrelated to the current review. He has received supplements to attend Cochrane meetings. He also has stocks and shares in companies that have no interest in the topic of this review (TIAA-CREF, Fidelity, Vanguard, USAA, MorganStanley).

Leopold Eberhart is employed as a clinical and academic anaesthetist with a clinical and research focus on postoperative pain management and postoperative nausea and vomiting. He has no conflict of interest regarding the topic of this review. Leopold Eberhart has received lecture fees (from Baxter GmbH and Fresenius GmbH) and payment for lectures (from Gruenenthal GmbH, Baxter GmbH and Fresenius, GmbH) and has provided consultancy (for Gruenenthal GmbH and ratiopharm GmbH) for topics not related to the current review. He holds a board membership with Gruenenthal GmbH Deutschland, which does not have an interest in the topic of this review. He has been involved in the conduct of phase 2 and phase 3 clinical trials related to the current review ("Amisulpride (APD421)" (NCT02646566 NCT02449291 Kranke 2018 Gan 2017 Kranke 2013; "Vestipitant (GW597599)" (NCT01507194); "Buspiron" (Kranke 2012); IMPACT study (Apfel 2004)). He was an author of several papers on postoperative nausea and vomiting.

Hannah Hartl has no conflict of interest regarding the topic of this review. Hannah Hartl is a medical student.

Olivia Jordan has no conflict of interest regarding the topic of this review. Olivia Jordan is a medical student.

Debora Mayer has no conflict of interest regarding the topic of this review. Debora Mayer is a medical student.

Manuel Riemer has no conflict of interest regarding the topic of this review. Manuel Riemer is a medical student.

Maximilian S Schaefer has no conflict of interest regarding the topic of this review. Maximilian S Schaefer is an attending anaesthesiologist. He was involved in a meta-analysis on the incidence of postoperative nausea and vomiting published recently (Schaefer 2016).

Diana Raj has no conflict of interest regarding the topic of this review. Diana Raj is a consultant in clinical anaesthesiology and a Trustee and Secretary of West of Scotland Anaesthetic Teaching (WOSAT), Scottish Charity SC04663.

Insa Linnea Backhaus has no conflict of interest regarding the topic of this review. Insa Linnea Backhaus earned her PhD in Public Health and is an academic researcher.

Antonia Helf has no conflict of interest regarding the topic of this review. Antonia Helf is a clinical investigator and academic researcher. She was involved in the conduct of phase 3 clinical trials related to the current review ("Amisulpride (APD421)" (NCT02646566 NCT02449291)).

Tobias Schlesinger has no conflict of interest. Tobias Schlesinger is a clinical investigator and academic researcher.

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Peter Kienbaum is employed as a clinical and academic anaesthetist and has been holding the position of vice chairman of the anaesthesia department for 10 years. His clinical and research work focuses on cardiovascular effects of anaesthetics and recovery after anaesthesia. Peter Kienbaum has been consulting for Baxter Germany, Air Liquide Germany, Orion Pharma Germany, and TEVA ratiopharm Germany, with respect to inhaled anaesthetics and other issues not related to this review. He authored several trial papers unrelated to the current review and was involved in a meta-analysis on the incidence of postoperative nausea and vomiting published recently (Schaefer 2016).

Peter Kranke is employed as a clinical and academic anaesthetist with a clinical and research focus on obstetric anaesthesia and postoperative nausea and vomiting. He has received lecture fees (from MSD, ratiopharm, Covidien) and has provided consultancy (to MSD, Ratiopharm, Covidien) on topics unrelated to the current review. He has received lecture fees and provided consultancy to Fresenius GmbH. This company manufactures propofol, which may be effective as an antiemetic in reducing PONV. He acted as a consultant for Acacia Ltd. He has been involved in the conduct of phase 2 and phase 3 clinical trials related to the current review ("Amisulpride (APD421)" (NCT02646566 NCT02449291 Kranke 2018 Gan 2017 Kranke 2013); "Vestipitant (GW597599)" (NCT01507194); "Buspiron" (Kranke 2012); IMPACT study (Apfel 2004)). He was author of several trial papers and of the consensus guidelines for management of postoperative nausea and vomiting. He has published research reports and editorial views on the topic under review and was involved in a meta-analysis on the incidence of postoperative nausea and vomiting published recently (Schaefer 2016).

DIFFERENCES BETWEEN PROTOCOL AND REVIEW

The protocol to the review was prospectively published in 2017 (Weibel 2017). We deviated from the protocol in the following points.

Copyright © 2020 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

- Types of studies: we have planned in the protocol that eligible studies must be published in a peer-reviewed journal. We changed this restriction and decided to include all studies that were published as full-text articles independent of a peer-review process. Peer review may be one reason for publication bias (selective publication of positive and significant results).
- Types of participants: we have defined in the protocol that we include adult participants (≥ 18 years) undergoing any type of surgery under general anaesthesia. During full-text screening, we have recognized that many studies have not reported any eligibility criteria or lower bound of age for study participants, or have used other definitions of "adults" starting with 15, 16, or 17 years. Because we are interested in the adult population in the biological sense, we extended our inclusion criteria for age as follows: for each study enrolling participants younger than 18 and reporting the mean age with SD, we assumed that a majority of participants are 18 or older, and that the study is eligible for this review, when the lower bound of the confidence interval (mean age ± 1.5 SD) is 18 or greater (Chebyshev's inequality). Similarly, if the study reports the median and the IQR of age with the lower bound of the IQR 18 or greater, then we can state that a majority of participants are 18 or older.
- New secondary outcome: complete response (number of participants without vomiting, nausea, or need for rescue treatment within 24 hours postoperatively). Complete response is an important outcome for participants in the postoperative period.
- Searching other resources: we have scanned the reference lists of included studies only of the following relevant systematic reviews Carlisle 2006a; De Oliveira 2013; Liu 2015; Tricco 2015a; Tricco 2015b. We have not scanned the reference lists of all included studies in the current review, and we have not contacted trial authors for further relevant studies in the field.
- Overall risk of bias summary: we have summarized the risk of bias for each study depending on judgements for the items 'sequence generation', 'blinding of participant, personnel, and outcome assessors', and 'incomplete outcome data'. At the protocol stage, we had planned to use the item 'allocation concealment' instead of 'sequence generation'. However, we judged only 69 studies (12%) that used either central allocation or sequentially numbered opaque sealed envelopes (SNOSE) as having low risk of bias for allocation concealment. In contrast, a total of 282 studies (48%) have reported adequate methods for sequence generation such as random numbers tables or computer-generated random numbers. We believe that most authors of previous studies were unaware of the definition and reporting standards of methods for allocation concealment. Most study authors have reported on sequence generation and blinding but not on allocation concealment. The term 'SNOSE' was used only in more recent studies. Therefore, we decided to use 'sequence generation' instead of 'allocation concealment', because we assume that allocation concealment may have worked in many more studies included in this systematic review. Reporting of methods used for allocation concealment is the real problem.
- Assessment of clinical and methodological heterogeneity within treatment comparisons: we had planned to use descriptive statistics as reported in the Characteristics of included studies table to assess whether studies within each pair-wise comparison are homogenous enough with respect to potential effect modifiers (risk of bias, intervention details, funding source), so that the assumption of homogeneity might be plausible. Finally, for the effect modifiers 'risk of bias' and 'dose of intervention', we accepted heterogeneity (see inclusion criteria of this review) and assessed the impact of these effect modifiers in either sensitivity analysis (risk of bias) or subgroup analysis (dose). Due to the quantity of data and lack of information for the effect modifier 'funding source' in many studies, an objective and reliable assessment of the distribution of this effect modifier within all comparisons was not possible. In general, we assumed that for all included studies, the study populations, interventions, outcomes, and study settings matched the inclusion criteria of the current systematic review. Thus, we concluded that there is no relevant clinical and methodological heterogeneity within treatment comparisons in the current review.
- Assessment of transitivity across treatment comparisons: we had planned to assess the assumption of transitivity by comparing the distribution of potential effect modifiers (see data extraction form 'Potential effect modifiers') across the different pair-wise comparisons. In case of intransitivity (e.g. substantially imbalanced distribution of effect modifiers among comparisons), we did not want to perform NMA. Finally, for the effect modifiers 'risk of bias' and 'dose of intervention', we accepted differences in the distribution of these effect modifiers across treatment comparisons (see inclusion criteria of this review) and assessed the impact of these effect modifiers in either sensitivity analysis (risk of bias) or subgroup analysis (dose). Due to the quantity of data and lack of information for the effect modifier 'funding source' in many studies, an objective and reliable assessment of the distribution of this effect modifier within all comparisons was not possible. In general, we assumed that for all included studies, the study populations, interventions, outcomes, and study settings matched the inclusion criteria of the current systematic review. Thus, we concluded that there is no relevant clinical and methodological heterogeneity across treatment comparisons (intransitivity) in the current review.
- Net heat plot: to locate sources of inconsistency, we had planned to use net heat plots. However, data were too complex to visualize net heat plots in a meaningful manner.
- Subgroup analyses: in case of heterogeneity or inconsistency, we had planned to explore potential effect modifiers as possible sources. Due to the complex nature of the review, we decided to perform only the subgroup analysis 'dose of the interventions'. In addition, we have added a table summarizing the most commonly used dosages, routes, and time points of administration of single drugs of direct interest for the primary outcome vomiting and have reported this information in the Effects of interventions section.
- Methods for analysing additive dose effects: we have added the analysis to test the assumption whether the effects of combined dose categories (e.g. low + recommended, low + recommended + high, recommended + high) are additive sums of their individual categories.
- Reporting of effect estimates: we decided the process/method of selection of effect estimates for reporting in the Effects of interventions section at the review stage after performing the analyses. Selection was not driven by specific results.
- Sensitivity analyses: we included two new sensitivity analyses on funding (funding source 'industry', funding source 'non-industry'). We added one new sensitivity analysis on 'single drugs only' including only study arms investigating single drugs and excluding study arms investigating combinations of drugs. This analysis compared the robustness of network effect estimates of the primary network meta-analysis and the sensitivity analysis including single drugs only (which is the basic analysis for the subgroup analysis of dose).

- 'Summary of findings' table and GRADE: at the protocol stage, we had planned to use the four-step approach by Puhan and colleagues (Puhan 2014). However, new and more efficient methods suitable for large NMAs have appeared during preparation of this paper (CINeMA: Nikolakopoulou 2019; Papakonstantinou 2018; Salanti 2014; Salanti 2017). We have used CINeMA, which enhances feasibility of performance of this review.
- Yvonne Jelting was involved in the protocol but was no longer an author of the review. Hannah Hartl, Antonia Helf, Olivia, Jordan, Debora Mayer, Manuel Riemer, and Tobias Schlesinger were not authors of the protocol.

INDEX TERMS

Medical Subject Headings (MeSH)

Anesthesia, General [*adverse effects]; Antiemetics [*therapeutic use]; Drug Therapy, Combination; *Network Meta-Analysis; Placebos [therapeutic use]; Postoperative Nausea and Vomiting [*prevention & control]; Randomized Controlled Trials as Topic
